A COMPLETE TABLE OF CONTENTS APPEARS ON PAGE 1735

THE PNEUMATIC CONDENSER

FOR DENSER GOLD FOIL AND AMALGAM FILLINGS

Both amalgam and gold foil are condensed to greater density with the Pneumatic Condenser than any other method. Hand pressure may be applied at same time the blow is delivered. Severity and length of the operation is reduced for both patient and operator.

Small size of the condensers allows them to be turned or the line of force to be changed easily.

Portable Pneumatic
Condenser Complete

Immediate Dentures!

YOU NEED NOT be concerned about retention in immediate dentures. A denture can be worn immediately after surgery with perfect retention, and without pain or discomfort, if it is lined with Konformax Rebase.

A lining of Konformax Rebase in a denture acts as a "cushion" that is very comforting to the patient, and also affords antiseptic protection. Such lining lasts from three to six months and can be added to at any time.

Konformax Rebase is equally efficient on partials as on full dentures . . . whether they be Acrylic, Metal or Vulcanite. Literature on request!

Just an M.O.D.—but it has

the Difference that's Distinctive"

thanks to "N.P.C."

A lot of "blood, sweat and tears" can go into an M.O.D. Inlay. Among connoisseurs of M.O.D.'s, this would be judged a p-r-e-t-t-y good one — beautifully carved occlusal; nicely fitting margins; properly placed contact points.

It's the net result of a relaxed, comfortable patient and a relaxed, unhurried dentist. Yet being unhurried, the dentist made his preparation more rapidly and more skilfully than if he had been worrying about his patient's discomfort.

That's the distinctive difference between Novocain-Pontocaine-Cobefrin and the conventional anesthetics in operative work. "N.P.C." anesthesia is deep; it's long-lasting; there is no increase in vasoconstriction; no perceptible decrease in patient tolerance. In operative procedures where pain or discomfort is probable, let your first step be

Anesthetize with "N.P.C."

ABOUT DENTAL ASSISTANTS

QUITE LIKELY you have forgotten all about it by now, but the September CORNER quoted and unquoted Miss E. A. Luster of Louisville (who works in the dental field); she reported an unhappy experience in a dental office. The quotes have stirred up Miss Betty Frederick of Canton, Ohio. Betty is secretary of the Ohio State Dental Assistants' Association. She writes a lively letter.

Betty wants to know if Miss Luster's dentist is a member of the American Dental Association. "I wonder," she adds. In her opinion, "It was very unethical of him to ask, 'Who put in that lousy bridge?,' " but admits that "comments like this are becoming commonplace, rather than the exception."

Continuing, Betty writes: "Why should a professional man have a 'listless assistant,' who reads *True Stories* while on duty? Or one who says, 'Well, come on in—I believe we can work you in somehow,' instead of having an emergency period with a definite appointment? And WHY [Betty put that in capitals] did the doctor go away and leave the patient alone? Where was his assistant? Is she a member of the American Dental Assistants' Association?"

(Continued on page 1712)

SPECIALIZED SERVICE—

NOT
mass-
produced
duplication

Your Durallium laboratory, however large it may be, offers you *specialized service*—not the impersonal standardization of mass production methods. Each case you send in receives individual attention; it is never handled in identically the same way as any other case.

Your Durallium laboratory offers you neither the speeded-up production time which means short-cuts rather than painstaking work, nor the depressed prices which mean substitutions instead of good materials. Chosen for its technical excellence, your Durallium laboratory guarantees you the fine craftsmanship worthy of your professional skill.

*available through your qualified Durallium laboratory

(Continued from page 1708)

Conceding that it all could have happened to Miss Luster, Betty Frederick goes on to say that "it is just such happenings as this that have prompted the American Dental Assistants' Association to inaugurate their Certification Plan of higher education for dental assistants. With study classes, supervised by members of the American Dental Association, we hope to help train dental assistants who will know their duties and diligently practice them." Dentists must do their part, she says, if the plan is to succeed. "It is only through dentists' cooperation that the Certification Plan can be worked out to the benefit of the individual dentist," she emphasizes.

She pleads especially for help from "the minority of dentists who think we are upstarts," adding that "in the end, it will benefit the dentist, and the dental profession as a whole, much more than it will benefit the individual assistant."

Success of the Certification Plan, in Betty's opinion, will guard against the recurrence of such episodes as the one Miss Luster described in these pages in September.

"Reading this in ORAL HYGIENE makes a conscientious dental assistant feel very shamefaced," says Betty Frederick. "There must be a way to make ourselves able to merit the esteem of the American Dental Association, and the only way I know is the Certification Plan. Believe me, we want to be of service to our dentists and to their patients. Our Dental Assistants' pin bears the words EDUCATION, EFFICIENCY, LOYALTY, AND SERVICE. It is our sincere hope and belief that we can live by these words, and the Golden Rule."

She closes her fine letter with thanks for ORAL HYGIENE's "earnest efforts to bring about a greater understanding among members of the dental profession and their auxiliaries."

The CORNER will be mighty glad to receive any other com-

ments that may occur to dental assistants or their bosses. ORAL HYGIENE has always tried to help dental assistants any way it could since 'way back in the days when the late beloved Juliette Southard worked so hard to improve the lot of assistants. She was my friend and I saw her often, and I knew how hard she worked. Our own main contribution to the cause in those days was a special edition each month for the American Dental Assistants' Association; it carried a section devoted to the association's affairs which tireless Juliette edited herself. When the organization grew large enough to start its own journal, ORAL HYGIENE's special edition was discontinued by mutual consent so that it might not interfere with the association's own new magazine.

Despite our not having carried the American Dental Assistants' Association section for many long years, the girls still seem to be reading ORAL HYGIENE itself with the same old interest.

Each month, we send a questionnaire to a cross-section group of dentists asking what they've read in the current issue. At the very end of the questionnaire, there is a pair of questions: "Do you employ an assistant? Does she read ORAL HYGIENE?"

This office's Number Nelly checked up a while ago on the answers to these two questions. She found that of dentists reporting that they *do* employ dental assistants, 83 per cent reported that their assistants *do* read ORAL HYGIENE. In arriving at the 83 per cent, Nelly excluded answers from all dentists who said that their assistants read the magazine only occasionally.

Thanks for writing to the CORNER, Betty. Do it some more, and encourage your friends to write, too.

A large percentage of the nation's dentists recommend Revelation Tooth Powder. This fact is indicated by surveys in many parts of the country. Cleans teeth safely, thoroughly, pleasantly. We invite you to test it at our expense. *Please include professional stationery with your request for samples.*

ALL METAL CANS

"All ingredients in FASTEETH meet the official United States drug standards for purity and quality."
Gum Koraya N.F.VIII, Sodium Borate U.S.P., Oil of Peppermint U.S.P.

AIDS YOUR PATIENTS IN DENTURE RETENTION

The function of a good denture powder is not to "stick" the plate in the mouth, but to help maintain the peripheral seal which is a fundamental necessity for denture retention.

FASTEETH is made from a carefully blended combination of gums designed to make it cohesive rather than adhesive. Thus, FASTEETH is not "mucilaginous" in function.

FASTEETH is alkaline and its alkalinity helps to prevent liquefaction by salivary acids. FASTEETH does not seep out readily from under the plate.

These are among the reasons why so many Dentists choose FASTEETH to give their patients longer and more pleasant aid while learning to wear an artificial denture.

ON THE FENCE" CONCERNING AND ANALGESIA?

Then this message is for you...

YOUR training and skill as a dentist are mighty important. But almost equally important is the time required these busy days to treat *all* your patients who need the benefit of your skill.

Doubtless you have the most modern dental equipment to help you make every minute count. But if you are not equipped with one of the dentist's most profitable time and energy savers—a gas machine—you owe it to yourself to give very serious consideration to this equipment.

Nitrous oxid analgesia is an effective means of controlling pain and discomfort in practically all the operative procedures in general dental practice. Result—cooperative patients . . . less nervous strain for the dentist . . . more operative minutes to each hour . . . and increased prestige as "the dentist who doesn't hurt". The patient-dentist relationship is enhanced.

In the field of gas anesthesia and analgesia, the Heidbrink Simplex has been the choice of thousands of dentists who find Heidbrink machines the modern, simplified means of administering analgesia and anesthesia with nitrous oxid.

Get the Facts To make it easy for you to study the value of the Simplex in your practice, we have available descriptive literature that gives complete information on the subject of dental analgesia and anesthesia. This information is yours for the asking. Merely mail the coupon—and then study the opportunity when you receive the complete details.

PLEASE SEND:

- ☐ Booklet—"A Simple Story that is making Dental History".
- ☐ Peebles Chart
- ☐ Pamphlet: The Principles of Administering Nitrous Oxid-Oxygen.
- ☐ Heidbrink Dental Catalog.

TORIT

Casting Machines

New
Sensational
Astounding

VAUGHAN CASTING MACHINES with CENTRI-VAC* attachment

*Patent Pending by A. L. Engelhardt, Los Angeles

**Combines vacuum with vertical centrifugal motion.
Two powerful forces that insure better castings.**

This new Torit casting machine represents the greatest single advancement in casting technic in years. It combines the pull of vacuum with the push of centrifugal motion. No matter how intricate the casting, the metal is forced into every margin, and held here.

The Centri-Vac makes possible complete removal of back pressure in the mold. There are no air pockets, and heat drawn through the investment from the melting operation maintains expansion in the casting flask. Castings are cleaner and much denser than is possible by any other method.

Vaughan Casting Machines with Centri-Vac attachment are available for immediate delivery in two sizes. For details and the latest Torit Dental Catalog write: TORIT MANUFACTURING COMPANY, 279 Walnut Street, St. Paul 2, Minnesota.

Torit Dental Products

Experience is the Best Teacher

JOHN HUGHES BENNETT (1812-1875) proved it in histology

Bennett's experiences, gained by linking physiology with clinical medicine, led him to institute the practical study of histology, to recognize the medicinal value of cod liver oil, and to be the first to describe the blood condition leukemia—Bennett's disease.

R. J. Reynolds Tobacco Co., Winston-Salem, N. C.

Experience is the best teacher in cigarettes, too!

YES! Millions of smokers found that cool, full-flavored Camels suit them best. Try Camels! See how the rich flavor of Camel's choice tobaccos pleases *your* taste. See if Camel's mildness isn't welcome to your throat. Yes! Let your taste and throat tell you why, with smokers who have tried and compared, Camels are the "choice of experience."

According to a Nationwide survey:

More Doctors Smoke CAMELS than any other cigarette

In a nationwide survey by three independent research organizations, 113,597 doctors were asked to name the cigarette they smoked. More doctors named Camel than any other brand.

BROAD PROFESSIONAL ACCEPTANCE OF

Forhan's *with massage*

for supplemental home use in

GINGIVITIS

is supported by Clinical Investigation

Impartial practicing dentists gave individual examinations to 1048 patients. 795 were found to be Gingivitis cases. 564 were first given prophylaxis. All were instructed to massage gums with Forhan's toothpaste.

Gratifying Results in 30 Days!

After 30 days, 95% of the Gingivitis cases showed marked improvement, and 100% of those with healthy gums had maintained them in normal condition! In view of these results, may we depend upon your continued acceptance and recommendation of Forhan's with massage as a between-visits home adjunct to professional treatment in Gingivitis?

My Friends As Patients

By **STANLEY C. BROWN, D.D.S.**

No PERSON can practice dentistry successfully unless his patients are his friends. Dentistry has not yet reached the point where it can disregard human relationships which, if cultivated judiciously, can blossom into cooperative friendships.

As poets conceive and portray friendship, few persons have more than one friend! But let us take a broader view of our friends in our practice and perhaps find the poet's friend outside our practice. For the sake of honesty, let us consider all patients as our friends and try to place them in their proper place on the ever-interesting list of cultivated friends.

Social Friends

High on our list of cultivated friends are our social friends—

friends we have made either through our dental services or some social function. These friends come to us for dental services as a matter of course. They really do enjoy our company and personality outside of business hours. Even a few of these friends seek our opinions relative to their vocation. They are impressed with our judgment and understanding of our vocation. But one must always be cautious of giving advice outside his own vocation, as many a well-cultivated friendship has been lost simply through offering "advice." But sincere counsel, based upon vocational practice and experience, will cement the ties of such cultivated friendships.

Then we have the usual type of friends, better known as casual friends. These friends love to call you "Doc," not in a sense of pro-

Is your relationship with your patients a friendly one?

fessional respect but rather in the spirit of "I knew him when." These friends are easy to draw into your practice but difficult to lose. They often expect service on the odd hours, at a reduced fee. Occasionally one of this breed will ask for a cash loan even though his office account may be long overdue. You may make the loan and eventually receive payment in full for the loan and account receivable, but it seems unwise to cultivate this type of patient friendship.

Critical Friends

One of the most interesting of patient-friends is the person who really respects your professional ability yet feels that this friendship is such that he can impose his concept of dental needs. This is the type of friend who will make you choose between actual dental needs and getting by with a service. This type of patient probably will stimulate all the unpleasant emotions known to man. The easiest way to handle such a situation is to have supreme confidence, just short of conceit, in one's ability to produce. Keep the ugly emotions well bottled up and put forward the supreme confidence you have in your judgment of dental needs over that of your patient-friend. Once this type of friend finds you wrong in your judgment, you can consider him lost to your practice.

This type of patient-friend tests your true professional ability.

Serve him well and you have a successful practice. He sends you new patients; he pays his bills on time. He is, indeed, a true friend of dentistry. His desire to dictate his needs to you is based upon past experiences where he did not understand his dental services. He simply lacks understanding of dentistry's possibilities and limitations. Once he finds you interested in relating dentistry to his particular needs, he will relax and submit willingly to your services.

Do you recall the patient-friend who always uses a small mirror to watch you operate? Remember how you maneuver so that her vision is impaired, and she tries to adjust herself to overcome *your* inconsideration? This type of patient is a nuisance because her maneuvering only adds up to a most unpleasant and unsatisfactory dental experience. No fee is large enough to compensate for the unpleasantness. It is better to suggest that such a patient seek dental services elsewhere.

Emotional Patients

Other patient-friends who test our ability to "win friends and influence people" are those who have acquired a fear and dread of any dental experience. To be sure few patients "love" the dental experience, but a few have no desire to control their emotions. They seem to feel that it is an endurance contest. They want the best in den-

tistry, the minimum of time and expense, yet seem to feel there need be no cooperation on their part:

Do you recall the friend who called you late one evening reporting a terrible toothache? You recommended a home remedy and had the patient call at your office before hours the next morning. Upon examination you discovered a long-neglected dental condition. It was almost impossible to render a completely satisfactory service in the time limit, but this friend was "scared to death" and expected you to perform miracles.

Do what you can to relieve the immediate complaint of such a friend, but in so doing be sure to impress the patient with the importance of his cooperation and interest in his own dental needs. This type of person can be placed upon your call list and, if followed up, can be developed into a most satisfactory patient.

A rational point of view toward all our patient-friends is one of personal consideration and professional services. Social friendships cease when the patient enters your operating room and submits himself to your professional judgment and services. This point of view must be assumed even though rendering a service for someone in the immediate family. Your wife and children should be regular patients, given every consideration other patients receive. Regular recall appointments during office hours is the only way one can provide an adequate dental service for

★ ★ ★ ★ ★ ★ ★ ★

members of his immediate family, unless one wishes this service to be rendered by another dentist at his regular fee.

In every practice we find a few more intimate social friends. These patients are most considerate, and usually cooperative if the office treats them with like courtesy.

Should there ever arise a choice between two services, the patient should always be consulted and given the opportunity to aid you in making the choice. However, no discount fee should ever be a factor. The merits of every service should be understood by both the patient and the dentist and a profit fee established.

Of course, there may be a few social friends who seem to feel that they should be given special consideration both as to appointment time and fee. This kind of thinking on the part of such a patient should be discouraged by wise counsel on the part of the dentist. Building and maintaining a practice on "discount-fee patients" is most unsound business and always leads to inferior services. Rather than developing a close bond of friendship and understanding, these unsound habits ultimately lead to misunderstanding and a strained, if not broken, friendship. And no

dentist has a worse enemy than one resulting from a broken friendship or from misplaced professional confidence.

The true friends in our practice are those who seek our services first because of another friendship. From this opportunity we either make lasting friends and patients or we send them away uncertain or disillusioned, depending upon our integrity and ability to serve. There are times when our fee may seem quite out of the reach of some of our friends, but this should be no basis for a lost friendship. Our integrity should weather this circumstance. Lowering a fee beyond all sense of profit and then rendering an inferior service is one sure way to lose a friendly patient.

Dentist-Patients

To render a dental service for one of your colleagues is a compliment indeed and warrants your best efforts. How to schedule this service time and the fee to be charged is a matter of judgment and personality traits. If two dentists get together for service exchange and devote all their time to telling stories or criticizing other dentists, then a different arrangement should be worked out for the patient's dental health.

In some cases it is wise to make a regular appointment with your dentist-friend and pay him his regular fee. Likewise you might render a better service for your dental friend if he too were treated as a regular patient rather than

"just a dentist." Dental friendships have been shamed because of inferior dental service rendered by one dentist to another. However, there is no reason why dental services cannot be exchanged. Where this plan is used, a regular appointment schedule is advisable and each dentist pays his laboratory and material costs.

Such a plan as this is not advisable between physician and dentist. This type of relationship is much better if a regular fee is charged and some mutual arrangement of professional courtesy discount allowed. This leaves both the physician and dentist free of any personal obligation when in need of professional services.

Also on our list of patient-friends are our relatives. When we buy groceries from a brother-in-law, we expect to pay the regular price. So, too, when the grocer-relative seeks our professional services. We give him our best and charge our regular fee. In cases where there will not be too many relatives in one's practice, a courtesy discount may be allowed.

Our friends understand us and value our services. They also appreciate the fact that we do have obligations to meet which demand that we make a profit fee for all services rendered and, therefore, cannot devote our practicing hours to friendly gestures. Let us derive pleasure from our services by making all patients friends and all friends patients.

This discussion of the oral manifestations of diabetes may help you in your dental practice.

Destructive Periodontal Disease Caused by Diabetes

By **LESTER HOLLANDER, M.D.***

DIABETES MELLITUS is a chronic disease which renders its victims incapable of metabolizing carbohydrates efficiently. Where the cause of this inability lies, whether it is in the islands of Langerhan in the pancreas, or in the parenchymal cells of the liver which transform sugar into glycogen, or in the tissue cells where the latter is

*Medical Director, Pittsburgh Skin and Cancer Foundation.

stored, or some place in the ductless gland mechanism such as the pituitary gland, is still undetermined. Fortunately, it is still the subject of intense study and search. Although great strides have been made in the appreciation of such basic evaluations as blood sugar determinations; urinary sugar output; the association of hypertensive diseases and diabetes mellitus; the use of diets, insulin, and vitamin therapy, diabetes mellitus is still one of most frequent causes of disability, distress, and death.

Improper sugar chemistry of the body renders it incapable of furnishing proper nutrition generally and also at certain specific locations, thus resulting in debility which leads to actual cellular demise.

This phenomenon then is responsible chiefly for the lack of proper protective ability against pathogenic microbic invasion and the formation of necrotic areas, abscesses, and gangrene which may occur at any site of the body.

All the foregoing is of common knowledge, but this knowledge is applied infrequently in the appraisal of localized necrosis of the gingivae or the periapical areas of the mouth. Perhaps a short recital of two similar case histories will serve to arouse the sympathetic interest of the dental profession. Since diabetes mellitus is a frequently encountered disease, this interest may produce beneficial results.

In two personally observed patients, the earliest appreciable symptoms of diabetes mellitus appeared in the mouth. In both patients soreness and edema developed at the gingival margins. This persisted for several weeks and made ordinary employed oral hygiene painful and even difficult.

While they were under the care of their respective dentists for this painful gingivitis, multiple apical abscesses developed which necessitated several extractions. The process of healing which followed was exceedingly slow. Severe inflammation developed at the sites of extraction. This at first was only distressing and painful, and was interpreted as a form of "dry socket." Later it assumed greater significance. In one patient all the upper teeth, and in the other one all upper and lower teeth, had to be sacrificed to a rapidly advancing alveolar disease.

Each patient was severely upbraided by his respective dentist: he did not brush his teeth properly and often. In each patient the collapse of the gingivae was interpreted by his dentist as an evidence of a local disease caused by calculus deposit, though curiously enough no such deposit was demonstrable. Through the entire period from the start of the stomatitis, each patient was subjected to topical treatment with supposed antiseptics and bacteriostatic and antibiotic agents.

Later, when other symptoms of polydipsia, polyuria, and lassitude

appeared, the presence of sugar in the urine pointed the finger to the real culprit of the cause of the apical abscesses. The association of the stomatitis, gingivitis, and periodontal disease later was understood when the control of the rampant sugar metabolism brought about a new and a healthier condition of the gingivae. The dentures which replaced the natural teeth at first could not be worn by either patient. Only after the control of the diabetes was it possible to make suitable and wearable dentures for each patient.

During the hectic period before the disease was diagnosed and during which the "battle of the dentures" ensued, all the difficulty encountered was blamed by the respective dentists on the lack of co-operation of the two patients. At no time did it occur to either dentist that there might be a systemic disease which was responsible for this deplorable condition. Not that technical books do not warn of these systemic causes, nor that the finding of sugar in urine and blood are such difficult procedures. Even a cursory review of the literature tells of this association of diabetes mellitus and gingival disease.

Kummel¹ in his classical book discussing pyorrhea alveolaris stated that diabetes mellitus plays an important role in many patients.

Thoma² in his excellent treatise on periodontal disease stated that diabetes mellitus caused these distinct symptoms in the mouth:

- a. Dryness
- b. Swollen tongue
- c. Viscous salivary secretion
- d. Swollen, red, spongy gingivae
- e. Calculus of supragingival nature, leading to marginal periodontitis.

Sutton³ described diabetic stomatitis as being characterized by deep red color and extreme dryness of the mucosa.

Wiener⁴ quoted Ruby and Cohen who examined the mouths of 403 diabetics and found 138 who were edentulous. They also found heavy supra- and subgingival calculus deposits in uncontrolled diabetic patients. Gingivitis, swollen and bleeding papillae, and abscesses were common. They also reported that the dental condition improved when the diabetes was controlled.

The dentist should bear in mind the role of diabetes mellitus under similar conditions and direct such patients to the proper clinicians for the needed blood and urine tests.

So You Know Something About Dentistry!

QUIZ I

1. Which of the following are inverted cone burs? (a) 33 $\frac{1}{2}$, (b) 35, (c) 8, (d) 37, (e) 38, (f) 556.
2. In hyperpituitarism with resultant acromegalia, is the maxilla appreciably affected?
3. The meniscus (interarticular fibrocartilage) is interposed between the condyle and fossa (a) at all times, (b) only in lateral movements of the mandible, (c) only in protrusive movements of the mandible.
4. Are silicate cements more ideal than amalgam with regard to thermal expansion?
5. Which of the following are used as accelerators in the setting of plaster of paris? (a) sodium chloride, (b) zinc oxide, (c) potassium sulfate, (d) sodium bicarbonate.
6. Ulcers of the mouth should be viewed with mistrust if persisting for (a) ten, (b) six, (c) two, weeks.
7. True or false? As the stimulating action of aromatic spirits of ammonia is of short duration, a moderate dose may be repeated in from fifteen minutes to half an hour when given by mouth.
8. In the rationale of the Howe technique, is eugenol (a) more effective than, (b) as effective as, (c) less effective than, formalin?
9. What type of cement is recommended for cementing acrylic veneer crowns?
10. The lesions of Vincent's (fusospirochetal) angina are confined to (a) the tonsillar tissues, (b) the pharyngeal tissues, (c) the tongue.

Is dental health related to physical environment?

Regional Dental Health Conditions

**By HERBERT H. SCHMITT,
D.M.D.**

DURING THE recent war years, I had an opportunity to observe the general and dental health conditions exhibited in a cross section of the many thousands of unemployed persons who came to Portland, Oregon, to work at high wages in the mammoth shipbuilding plants. The workers included

engineers, architects, machinists, mechanics of various kinds, white-collar workers, and many farmers; more than a hundred thousand men and women of all ages from every state in the country.

My experiences with many of those people unfolded an amazing dental health picture which differed in persons according to the area where they were born and reared. One of the outstanding

features observed was the better dental health conditions and less dental caries exhibited by persons from the area embracing some of the fringe states of the South, extending from Virginia to Florida, west to Texas, and then northward, embracing the states immediately east of the Rocky Mountains, to the Canadian border.

What could possibly have been the factors or pattern which produced the favorable dental health phenomenon exhibited by those people from that section of our country? Was it brought about by more actinic rays in sunlight, by the quality of the soil and food, or by the better selection and use of the food and its better digestion and resulting normal metabolism? Climatic conditions and food quality probably were important factors.

Persons from that area, with some exceptions, exhibited better calcified teeth and jawbones, good tooth alignment, ideal toothform with proper contact surfaces, and firm healthy gingival tissues. Groups from other areas exhibited, in contrast and with some exceptions, every degree of dental caries, defective calcification, degenerated toothform, open contacts, deformities, malpositions, weak and flabby gingival tissues, acid mouth secretions, hypersensitive teeth, diseases of the investing tissues, and premature loss of many teeth especially among younger persons.

A variety of theories or concepts have been propounded in an effort

to explain the probable causative factors involved in the annoying and destructive pathologic process of dental caries. Perhaps some accepted concepts concerning dental caries are as yet superficial and provincial. They lack sufficient biologic facts based on clinical experience with a variety of patients living in different climates or environments and on diets different in nature and quality over a period of years.

Diet

Unfortunately, because a carious tooth cannot be restored by the process Nature uses in healing a broken bone or other impaired tissue, a popular belief persists that our teeth are merely mechanical units without vital connections with the body's complicated blood supply and nervous system. That belief is fostered by the phenomenon of carious teeth developing, sometimes extensively, in those who claim to follow a balanced or basic diet formulated by medical and dental systems of applied nutrition. It also is fostered by the fact that a restored tooth often develops recurring caries, regardless of the use of a so-called basic dietary plus local protective measures. When caries thus occurs and persistently recurs, the laity inquire, "How come?"

After many years of clinical experience in battling the various forms of bad dental and related systemic conditions, it became evident that dental diseases and de-

formities can be and often are just as deep-seated and complicated as are other systemic ailments. Also, it appears there are two general types of dental caries as to origin:

1. Those cases which develop as a result of local oral conditions under normal systemic conditions.

2. Those cases which develop as a result of disturbed systemic conditions, usually a sequence of functional disorders; or as a result of the effect on the glandular system, in early childhood, of toxic infectious diseases usually associated with a deficient dietary regime or a weak digestive system; plus adverse local oral conditions.

The local origin type of caries comprises a small per cent of total cases and is well known to develop primarily from the action of acids or similar agents which form when certain food remnants, including such as sweets, milk, meat, or other fermentable agents, become lodged between the teeth or in pits and fissures in tooth surfaces. The destructive agents formed there gradually break down a small point in the enamel by a chemical process. This forms the initial lesion; followed by the destruction of adjacent tooth structures. Recurring caries seldom occurs in this type of cases.

The systemic type of caries develops primarily from an unbalanced or excess acid-forming dietary. The resulting unbalanced body chemistry produces salivary secretions weak in alkaline buffers

and acid mucous secretions in the gingival area which attack and dissolve tooth structures extensively. This is aided by products formed by bacteria and fungi, usually present and active in such a favorable medium, plus the ferments formed from food residue which becomes lodged on or in between some or many of the teeth. Recurring caries in restored teeth is the rule in this type of cases. Prolonged nervous tension is believed to be a factor in disturbed metabolism.

Food Elements

It is well known that in some areas of this country the soil has become depleted of certain elements necessary for the growing of quality foodstuffs. It is recognized that the soil in some areas is naturally devoid of elements such as iodine, fluorine, iron, and manganese, all of which are deemed important for good nutrition, especially in early childhood. Early in my dental career, cod liver oil was extensively prescribed for youngsters to aid nutrition and normal growth. Its taste was not pleasant but, fortunately, it contained, among other things, traces of iodine, fluorine, and vitamins A and D. The human organism in early childhood must have all the necessary food elements available in order to develop normally; especially all its functional organs.

Research investigators have stressed in recent decades the im-

portant part played by the glandular system; especially the thyroids, in metabolism. Under normal body conditions, the thyroids help to develop and maintain normal health and sound dental health. Perhaps this is not fully appreciated by some dieticians.

Dental Caries

Frequently, cases of rampant caries are encountered in both parents and their offspring. Apparently, such a dental condition can be said to result from an inherited tendency toward chronic faulty nutrition or metabolism; and this constitutes a condition which I prefer to call an "hereditary dental caries diathesis." Attempts to correct such a complicated internal condition by the use of vitamins or calcium compounds have not worked out effectively. The prescribing of large amounts of milk in the daily dietary has not produced the desired results and may aggravate the bad situation.

Normal health results from the operation of normal body functions. Disease, including dental lesions, results from abnormal body functions, or impaired metabolism, which may be inherited or acquired through the lack, the misuse, or the faulty digestion of quality foodstuffs, or through disturbed glandular function, plus the influence of an adverse local environment and nervous disturbances. Local environment includes those cases of dental disease developing as a result of blood

stream contamination in the handling of toxic metals, toxic chemicals, toxic drugs, and the processing of certain foodstuffs. Usually such contaminations involve the physiology of the facial artery.

A sound dietary must possess the necessary elements to produce and maintain the normal pH or acid base balance of the body; especially in early childhood, in order to bring about the development and maintenance of sound dental structures. A basic dietary which is adequate to meet the needs of one group of people may not be adequate for the needs of a different group living in a different climate and having different environment, a different standard of living, or different hereditary tendencies.

We must diagnose dental conditions in relation to possible disturbed systemic conditions, including hereditary factors, or occupation contaminations; and we must regard some dental lesions as an external oral manifestation of internal disturbed conditions. The restoration of a carious tooth or other local efforts to correct oral or dental difficulties, are only parts of the necessary health services to be rendered. Attention to systemic conditions is equally important and necessary if one is to render a reliable dental health service of permanent value to the patient and of satisfaction to ourselves.

2015 North Kilpatrick Street
Portland 3, Oregon

Don't "Lend-Lease" Your Name

By **HAROLD J. ASHE**

DENTISTS RIGHTLY count as their most valuable—if intangible—asset their good name in the community. This includes not only the respect in which they are held by their associates, patients, and friends, but the impression that strangers have as to their professional and personal integrity.

A good name is not inherited; it is earned by the dentist's day-to-day actions and behavior; by his reaction to situations; by his conduct toward his fellow men. He can

lose it by the scratch of a pen, the nod of his head, by a promise given without reflection. Without the dentist's character undergoing any change whatsoever, his reputation can be destroyed overnight.

In no way is it easier for one to lose his reputation than by "lend-leasing" one's name to some allegedly worthy cause, which later events expose as a fraud upon the public, and in which the innocent and well-intentioned sponsor must bear his bitter share of responsibility.

These causes are as varied as the

Investigate carefully before becoming a sponsor of any cause.

fertile minds of their promoters can devise. They range from stock swindles to every conceivable type of charity racket. All have one thing in common: to fatten the pocketbooks of the promoters.

Industrial Promoters

Every year communities, about the time the sap starts to run, get the urge to grow, to gain new industries. This is a perfectly legitimate ambition. It is this fact, however, which disarms professional and business men, makes them ripe for exploitation by industrial promoters whose intentions are dishonorable. These promoters have on tap a wide assortment of blue-sky propositions designed to intrigue the most exacting. Or, they are prepared to go along with whatever the community already thinks it wants.

Promoters have long since learned that, coming in as strangers, they can get nowhere unless they "sell" some of the town's leading citizens. They concentrate on key people. Maybe the mayor is made president of the corporation, and is "slipped" some promotional shares free. A few other shares are distributed where they will do the most good. The board of directors may include a prominent dentist, a surgeon, a small candy manufacturer, the town's wholesale grocer, and the retired superintendent of schools, many of whose former students are now

in middle years and ripe for plucking.

Now the corporation is ready to peddle its stock. It has prominent men who have either been bribed with free stock, or who have foolishly put up their own money in the mistaken belief that such an industry will benefit the town. Acting on faith in the integrity of the board of directors, all of whom are well known and have been hand-picked for that reason, townspeople buy stock with their savings. They cannot lose. A four-color prospectus that a legitimate stockbroker would shun sets forth fanciful figures assuring all that fabulous profits are inevitable. Despite the fact that businessmen are on the board, each of whom has complained about the nominal profits in his own business, none seems to have the wisdom to question these figures, or to investigate realistically the possibilities for success for the factory.

Investors

A retired postal clerk takes his life savings to buy stock because he has confidence in his fellow townsmen on the board. A minister invests \$1,000 painstakingly saved out of twenty years of church labor. A scrub woman, seeing the dentist's name on the advertising literature, and insisting "he's the most honest man I've ever known," digs \$200 out of a fruit jar and is on the road to riches,

Six months, a year later, the bubble bursts. The promoter fails to return from a business trip. The funds are gone. The company is hopelessly insolvent. Maybe stockholders will get 10 cents on the dollar.

That's one way for a dentist to "lend-lease" his name and lose it!

Another suicidal way to destroy one's good name is to endorse a charity racket. There are undoubtedly more charity swindles in the United States than there are legitimate charities. Unfortunately, the swindles are not well known by name and, in fact, the promoters deliberately change organization names when exposed and move on to greener pastures.

About all that is required to start a charity swindle is an office, some high-grade stationery, well-illustrated folders adorned with "tear-jerking" scenes, a reasonably bright promoter, and an imposing list of "sponsors." No charity swindle is really a success unless its letterhead carries an extensive list of the names of prominent sponsors printed on the left-hand side of the letterhead, sometimes overflowing to the back of the sheet.

Charitable Object

There is one other requirement: an object for which the charity is being conducted. This last presents no obstacle, as any experienced promoter can come up with a worthy cause. It may be to build a

clubhouse for delinquent children, or provide decent burials for circus aerialists. The charity may be a purely local affair, or be national in character if the promoters are "big time" and imaginative. It may be international in objective, such as succoring the European refugees.

Another point to remember is this: the object of the charity is usually one that sensible people with humane instincts and normal reactions can endorse. This is no assurance the objects will benefit, or that management is even well intentioned, though it may be, if bumbling.

This is not intended as a reflection on the thousands of soundly managed bona fide charities which are doing such excellent work in America and throughout the world. However, by the excellent records of such organizations, swindlers find it easy to set up shop. They copy the techniques of legitimate charities; including the inevitable "sponsor lists."

As in stock-promoting swindles, so too in the charity rackets, sponsors serve as bellwethers leading the sheep in for shearing. There are bellwethers and superbellwethers. The superbellwethers are used to get the ordinary bellwethers. That is how the unsuspecting dentist is wangled into consenting to act as sponsor.

Probably some prominent clubwoman with a long record of good deeds is persuaded to serve as "honorary chairman" of the or-

ganization, or perhaps it is a widely respected educator, or a nationally known scientist. Being beyond suspicion themselves, and usually not too worldly wise, it never occurs to these people to investigate either the promoter or the organization. If the objective is good—and it always is—that is about as far as their questioning goes.

Sponsor Lists

The next step is to build a sponsor list. The honorary chairman personally may approach certain prospective sponsors. More likely, organization employees will do this, get signatures on sponsorship cards. Or letters, over the honorary chairman's signature, may bring in a shower of acceptances from sponsors. The swindle is off to a fast start.

After the field is thoroughly worked, the promoter quietly folds his tent, moves on to the next city. Or, if he "hits a natural," he may settle down for a long stay, channel just enough money to the charity to keep the legal heat off. Strangely enough, it never occurs to sponsors to see the books or ask for an audit. This sort of thing sometimes goes on for years until a scandal breaks, and the sponsors run for cover.

Aside from organizations of un-

questioned purpose and management, dentists would be wise to observe a rule of never "lend-leasing" their names, least of all to organizations in which they have no actual part in managing even though being expected to give blanket endorsement.

If a dentist is asked to sponsor an organization of questionable standing, he should dismiss from his mind the question of whether or not the charity objective is worthy. This becomes unimportant. Neither should he be swayed by friendship or respect for the honorary chairman and other sponsors. His first consideration should be: who is the promoter or what is professional management? What is his or their past record? If they have promoted or managed other charities, what percentage of the receipts went to the charity? The promoter's word should not suffice. Get independent information on this vital point. If such information is not available, that should be warning enough.

After these points have been settled satisfactorily is time enough for the dentist of unquestioned integrity to comply with the request for endorsement. Even then, there may be an undetected element of risk.

2002 Knopf Street
Compton, California

By M. R. STERN, D.D.S.

FOR SOME MONTHS dentists have been feeling the brunt of changing circumstances. They are meeting "buyers' resistance." Patients come to their offices for emergency treatment only. They weigh fees. They postpone contracting for restorative treatment. More appointments are canceled and recalls are unanswered.

For an explanation of this situation, one need look no further than the editorial page of his favorite newspaper. Almost daily, one sees the cartoons depicting "H.C.L.," the wage and price spiral, and the demon inflation. Just what is inflation?

For one thing, it must be emphasized that inflation is not prosperity. Rather, it is a threat to prosperity. While everybody

seems to be working and earning more money, they are having difficulty with their budgets. Money is getting less valuable. Daily, the things one needs and buys are getting dearer and dearer. That is inflation!

Also, one becomes aware of an atmosphere of growing unrest and even discontent as more people find it hard to make their apparently increased earnings stretch to satisfy necessities. When prosperity becomes so unequally distributed that many suffer, that is inflation.

Buying Power

The dentist who grossed \$10,000 last year is worse off than when he made \$5,000 in 1939. This is so because his taxes are higher and the buying power of his dollars is off more than 40 percent. Every

You may be able to avoid the financial hazards of inflation by following the suggestions in this article.

dentist who has a bank account; owns life insurance, bonds, or other fixed-income paper; every dentist who is on a salary; every retired dentist who depends upon a pension, an annuity, or a retirement fund; all are being hurt by the shrinking purchasing power of their dollars. That is inflation!

Inflation is something to think about, something to watch, and something for which to plan. It is not a new phenomenon—it was recognized as early as the Third Century—yet no general rule can be laid down about protection against it. It is well to know the complexity of its forces. It is well to acknowledge the uncertainty of dogmatic criteria. It is futile to look for push-button specifics or panaceas. What has worked in the past may or may not, because of changing conditions, work this time. But those who are alert will try to find ways to protect themselves—to hedge—against its most harmful results. Those who are less wary or those who are more optimistic may have to bear the shock of its devastating effects. Now, perhaps, is the time for making vital decisions

What can the dentist do to protect himself against inflation? What safeguards can he consider in regard to the preservation of, first, his practice; second, his possessions, savings, and financial status; and, third, his position in

his established social environment?

The dentist whose patients belong to the middle strata of our society, the so-called white-collar job holders, professional people, civil service employees, has a serious problem. The dentist whose practice is made up of industrial or agricultural people or the executive element of large distributive centers is more advantageously situated. Older people, those retired or pensioned, and that large segment commonly known as the low-income group, also present the gravity of high prices. With each turn in the inflationary spiral, the dentist will encounter another group of patients who will question fees and complain of the difficulty of meeting dental costs.

In the office, the problem calls for greater effort in matters pertaining to practice administration. Overdue bills, debts, and mortgages on equipment should be paid off with inflated dollars. Expenses need greater scrutiny. Purchases are to be made on a "when-needed" basis. Efforts at collections and recalls should be intensified. Fees should be increased in keeping with rising costs, but it may be expedient to maintain existing schedules or to arrange a time-payment basis for deserving patients.

It may be possible to increase operating efficiency or at least re-

duce deficiencies by standardizing techniques, by giving more time to exploration, and by prescribing more fully toward complete rehabilitation. Income may be enhanced or credit loss may be reduced through modifying recommendations as to type and nature of restorations. A more comprehensive use of office and equipment facilities can easily lead to better income for the dentist as well as better service for his patient.

A greater diversification of patient groups may be cultivated. Neglected branches of dental treatment such as root canal therapy may be resumed with profit and perhaps pleasure. But as much as improvement in administration is desirable and beneficial, it is equally important that dentistry's high standards be maintained. The practice which is built on principles of sincerity, fairness, service, and reliability will endure.

Regarding the preservation of the dentist's assets, what is the best protection? It certainly is not cash! It buys less and less. Yet how many dentists will cling to large bank accounts? It is not life insurance! To be sure his beneficiary will receive \$10,000 for the \$10,000 the dentist put into insurance; and the annuitant will get the monthly checks for which he arranged; but when he exchanges these for food, clothing, and shelter, there is likely to be disappointment.

Nevertheless, some cash and

some insurance must be held in readiness for immediate contingencies. With that established, the balance of the dentist's insurance and cash should be brought into focus with the degree of inflation. The objective here should be to enhance future purchasing power for his own benefit and that of his beneficiaries. Each person will have to work out the details to suit his particular circumstances and objectives. The following is a suggestion to guide him:

Insurance

The dentist who is certain he can pass a physical examination may consider buying term insurance in sufficient amount to assure his beneficiaries improved buying power. A convertible term policy can later be "converted" to ordinary life, or any other form of contract, without the necessity of another physical examination. After the term insurance is acquired, he should drop his old policies and use the cash values to better advantage. Incidentally, he may require less coverage later as his beneficiaries would be older and less dependent. Savings may be effected by changing to term despite acquisition costs and a higher rate at a higher age.

The dentist who is unable to pass a physical examination should consider borrowing on the cash values. Interest rate at his bank will most likely be considerably lower than at the insurance company.

Here, two considerations—two exceptions—are worthy of emphasis. First, old policies are to be studied carefully as they may contain valuable and irreplaceable benefits—disability clauses for example. *Such policies should not be converted!* And, second, the dentist who has large funds sufficient to approach other media of inflation protection may see fit to regard his life insurance and its cash value as a stabilizing element in his portfolio. He may reason that their reduced purchasing power is a necessary risk or penalty in view of the safety of the principal.

Investments

Assuming the dentist has gathered up the surplus cash from his savings account, fixed income paper, and life insurance cash values or loans, he now proceeds to invest this cash, and future savings, to improve buying power at a pace in keeping with the progress of inflation. The following are some forms of investment that have proved satisfactory in the past:

Real estate is a good protection against inflation. But real estate values perhaps already have outrun other prices. Besides, increasing taxes and construction costs limit its appeal. However, owning one's home may be regarded as a primary hedge and the reduction or paying off of a mortgage with inflated dollars an advantage.

Gold and foreign currencies have proved effective hedges in

past inflations. But there is a law prohibiting the hoarding of gold. And foreign currencies are out of the question now as they may not be worth much should the United States' benevolent patronage be withdrawn suddenly. Dental scrap and filings may be accumulated and recently bottled ore has been made available. The American temperament, however, does not take too kindly or too readily to the practice of hoarding.

Various collections such as stamps, rare coins, art objects and paintings, antiques, precious and semiprecious stones are hedges that merit some consideration.

After gold, selected common stocks of certain industries appear to be a valuable protection against inflation. It is generally agreed they offer a large degree of protection. It is not too difficult to determine which stocks and which industries, but judgment and care are indicated here for much depends upon the political scene and also the mood of government.

Industry

The equities of those industries which fall in the category of tangible commodities—real goods—have in the past been suitable hedges. These include such industries as building, chemical, mineral, oil, and others. The reason for this is simple. The prices of oil in the well, of potash or copper in the mine, or of lumber in the forest should advance as inflation progresses, Cap-

ital in the form of plants and machinery, if modern and in working order, adds to these values. But perhaps more important is the earning record and the potential earning power of these industries. Only the strongest corporations, those that have weathered previous storms and survived, and whose earning prospects will keep pace with the advance of inflation, are to be considered. Also—and this is important—those which are most likely to escape government regulation and price fixing.

Above all, experience suggests that diversification—the spreading of one's assets into several of these categories rather than concentration in any one—is the prudent course to follow.

Socially and perhaps even politically, if inflation lasts several years, the dentist will find it increasingly difficult to maintain a balance between his earning and spending environments. Living standards should be kept in check, for prosperity turns out to be fictitious as high taxes and high prices cut deeply into savings and buying power. Among his family, friends, and neighbors, the dentist will witness the wild excitement of pseudo-prosperity on the one hand and the perplexed anxiety of those whose incomes are insufficient to meet advancing living costs on the other hand. Foresight and not complacency will prepare him for the so-

cial and political bewilderment and its consequences which may lie ahead.

To business, inflation is a stimulant. But its exhilarating effect is lost when it becomes fixed into the economy of the country—when it becomes habit forming. It becomes dangerous when ever-larger doses are required to maintain the status quo. The fear that no more inflationary dosage will be forthcoming may result in economic recession. Deliberate and sudden stopping of the inflation will bring on collapse and depression.

Government has the means and the power to stop inflation if it can find someone who dares or even cares to do it. Since such efforts may bring about a reversal of trend to be followed by deflation, there is little wonder that politicians steer shy of this. Instead, government warns of the dangers of sobering up too fast while it attempts treatment by reducing the inflationary dosage and fortifying it with anti-inflationary ingredients, such as higher interest rates, credit restrictions, price ceilings, and other palliatives.

A day of reckoning is coming, of course. It can only be hoped it will not be the devastating kind witnessed two decades ago. Prudence and experience call for an effort at self-preservation.

Raise Your Son

To Be a Dentist

Does your son have an unbiased familiarity with the advantages and disadvantages of being a dentist?

By ARTHUR H. LEVINE, D.D.S.

MANY DENTISTS are missing an excellent opportunity of "selling" dentistry to their sons as a professional career. Maybe they are too close to the trees. Or perhaps it is difficult for a dentist to be objective in comparing his profession with other vocations.

Despite the increased use of aptitude tests and guidance in the high schools, the majority of students on graduation day have not decided on a career. It may not be a major handicap for a boy not to know what he is going to do. But it certainly is a short cut for the student who sees a straight path to his goal. He does not waste time in

college taking the wrong courses and he is not as likely to be worrying about the future.

A dentist's child can be spared the ills of indecision if the father has started building early enough. It is assumed, of course, that the boy possesses certain aptitudes such as average finger and tweezer dexterity. This can be determined easily if it is not already obvious. He should have an average ability to work with his hands and a desire to learn. The majority of boys entering college would meet these requirements.

Does the boy have to like dentistry? The answer is "no." It is almost impossible for anyone so young to form a well-founded af-

fection for any vocation. The average boy of 16 or 17 believes that a lawyer spends most of his time in court declaiming before a jury in a sensational murder case. He has his imaginary physician saving lives all day in the operating room. And the engineer is designing a George Washington Bridge or a Boulder Dam. But the dentist—he spends most of his waking hours putting his hands in people's mouths. What could be worse!

If a dentist comes home and groans about his back as he drags himself to a comfortable chair, or sputters about the patients who do not pay their bills, it will leave a deep, unpleasant impression with his son. It is normal to "sound off," but it is wiser to do it out of hearing of a child. He will only magnify it far out of proportion to its worth and, consequently, get a distorted picture of the profession.

The grass on the other side of the fence always looks greener. Dentists, like all others, suffer from this hallucination. But an appraisal of the dental profession reveals some interesting comparisons.

Professional Advantages

In dentistry, your boy will be using his hands and his mind in a happy combination. So many occupations lean too far in one direction. Here he will be refreshed by being a surgeon, a mechanic, a designer, and a psychologist, all in one day. Removing a tooth can

never become monotonous. No matter how many inlays a dentist has made, it is always a thrill to see the finished product. Designing replacements for lost teeth can never become standardized. And the stimulation of meeting patients is never ending.

As a dentist, your son will be his own "boss." This is a matter of no small import. The world is full of thwarted people whom economic circumstances have chained to a position that they detest because of their employer. As a member of the dental profession he will command admiration and respect in his community, for he will have both skill and learning.

Many a dentist has considered the medical profession eagerly for his son. However, a physician is never free from the responsibility of life and death. No one who is not intimately associated with the medical profession fully appreciates the toll this exacts. This heavy responsibility and the irregularity of home life are two heavy marks on the debit side of studying medicine.

Shortage of Dentists

Your son's possibilities for success in dentistry are tremendous. In fact, he cannot miss. Because of a multiplicity of reasons, anyone being graduated from dental school today is assured a livelihood. And when that graduate's father is a dentist, the situation is even better.

Even before the last war, a

shortage of dentists existed. This may be difficult to believe in view of the heavy concentration in city areas. But the fact still remains that more dentists were dying each year before the war than boys were being graduated from dental schools. Thousands of boys came out of the Service with a new appreciation of dentistry. Add to that the fact that dental education of the public throughout the country is spreading rapidly, and you have two of the reasons for the shortage of dentists today. It is known in the profession that entire counties exist without a dentist. Some dental educators consider the shortage of dentists in this country rather grave.

This assurance of success must not be misconstrued, however. Dentistry is still a strenuous profession, physically and mentally. And building a practice is still a slow, tedious task. But there is not a boy who is not willing to take all that, provided that gnawing uncertainty of his financial future is cut to a minimum.

Professional Disadvantages

There are two disadvantages of dental practice with which your son should be familiar before deciding upon it as a profession. One is the strain of standing all day, usually in one spot; and the other is the exhausting task of perform-

ing painstaking procedures on a moving, human being. Yet, with proper planning, even these disadvantages can be overcome. Few dentists use an operating stool today. Despite their awareness of the importance of sitting down, they still persist in the old habit. If they would use it even part of the time, it would be of inestimable value. The second ill can be cured by planning diversified tasks and adhering to a practice day that is short enough to provide ample time for mental relaxation and recovery.

Whether a son should go into the same office with his father is debatable. Often the move is prompted by financial considerations since it is an easy way for the son to establish his practice. But the need for him to learn through his own experience, plus the personality factors involved in the best father-son relationship, would seem to indicate that, from the long-range point of view, a boy is better off starting by himself.

Regardless of how a son finally enters practice, however, if a father will recognize, without bias, the advantages of his profession, and will instill in his son the appreciation and respect that profession deserves, he will do his son, himself, and the public a favor.

Dentists in the News

Boston (Massachusetts) Herald: Doctor John R. Wallace, of Winchester, has been appointed by Governor Bradford to the special recess commission to study laws pertaining to the Board of Dental Examiners. Doctor Wallace was former President of the Massachusetts Dental Society.

Des Moines (Iowa) Tribune: "I wouldn't be surprised if within a year or two I give up dentistry and start a boat-building plant in Minnesota, at Bemidji, or some place like that," Doctor Fred Bunker, Lake City, Iowa, dentist says. "I've liked dentistry, but it gives me a lot of personal satisfaction to produce things which make people happy. I don't think people get fun out of dental work—but they do love a good boat."

This dentist has been practicing dentistry for twenty-five years, but he started boat building as a hobby only about a year ago. In that time it has become a growing and profitable business. Doctor Bunker's dental office is close enough to his boat-building shop so that he can work on boats between dental appointments. He is an excellent craftsman. He has patents on a number of improvements in dental instruments and has devised outstanding machines which he uses in boat building. He is perfecting an automatic bowling pin-setting machine.

Cleveland (Ohio) Plain Dealer: Doctor J. W. Moats, a practicing dentist and the mayor of Chardon, Ohio, be-

lieves that a radio going in his dental office has a good psychologic effect on his patients. Recently he had just finished preparing an elderly woman patient for an extraction when over the radio came "Nearer My God to Thee."

"You certainly have appropriate music for a situation like this," the woman said.

Erie (Pennsylvania) Daily Times: When the fireproof structure which is to be the O'Leary Dental Clinic in Girard is finished, it will be one of two or three such clinics in this country. Staffed by the well-known family of dentists, it will have the possibilities of becoming a Mayo clinic for dentistry.

The clinic is backed by Doctor J. T. O'Leary and his sister, Doctor Bertha P. O'Leary. Practicing with them will be Doctor Timothy O'Leary, son of Doctor J. T. O'Leary.

The building will have reception rooms, office, seven operating rooms, three laboratories, and a specially furnished room for making dentures and other dental appliances. All equipment will be of the latest design in dentistry.

Other dentists in the O'Leary family are a brother, Doctor M. R. O'Leary, of North East, and brothers-in-law Doctor Ralph C. Scragg, of North East, and Doctor W. D. Husted, of Albion.

Kansas City (Missouri) Star: After fifteen years as a baton-twirler, Doctor George R. Rhoades has put aside his batons for dental instruments. Following a year's postgraduate study at the

Kansas Medical Center which ended last May, this dentist opened his office in Kansas City. Now his baton-twirling

sions and his one regular engagement as a twirler with the Ararat Shrine drum corps.

Doctor Rhoades learned baton twirling while in high school. After he was graduated from high school he established his own twirling school which he operated while he attended the University of Kansas. He closed this school when he entered the Navy where he served as a Lieutenant with the Dental Corps. For nine months he traveled with the Navy band as a twirler.

While a student, this dentist won seven twirling championships.

activities which paid his way through school will be limited to special occa-

Awards for items published in this month's **DENTISTS IN THE NEWS** have been sent to:

PHILIP BRADY, Box 92, Sturbridge, Massachusetts.

R. H. RICHARDS, D.D.S., 523 Second National Building, Akron, Ohio.

NATALIE L. WEST, D.D.S., 56 North Sprague Avenue, Pittsburgh 22.

JEAN BRAND, 10 Allen Place, Columbia, Missouri.

CAN YOU USE A DOLLAR?

TO EVERY READER who contributes a newsworthy item, something unusual about a dentist, *which is published in Dentists in the News*, we will send promptly a crisp, new one dollar bill. Every clipping must be taken from a newspaper and carry the name of the publication and the date line. Clippings submitted cannot be returned. When more than one copy of a clipping is submitted, the first one received will be used. Send all items to *Dentists in the News*, ORAL HYGIENE, 708 Church Street, Evanston, Illinois.

DENTIST ADVOCATES MILK BLOCKS IN CELLOPHANE

A PLAN for the delivery to the doorsteps of homes of frozen blocks of milk wrapped in cellophane has been submitted to the Victorian Government by Doctor George Philpots, a dentist who is President of the Victorian Food Education Society.

Under this plan, milk would not be pasteurized. Instead it would be frozen at the point of production to reduce contamination. It would be kept frozen until it reached the consumer.

Doctor Philpots reports that his system would be cheaper than pasteurization methods used in Victoria at this time, and would do away with expensive milk bottles and the high cost of delivering milk during the early hours of the day.—*Sydney (Australia) Smith's Weekly*.

Portraits and Profiles

OF AMERICAN DENTISTS

By HOWARD A. HARTMAN, D.D.S.

Left to right: Olin Kirkland, member of the Advisory Council of Atlanta-Southern Dental College, Emory University, Atlanta, Georgia; Ralph R. Byrnes, Retiring Dean of the Dental College; and M. D. Huff, retiring Professor of Therapeutics.

James Armstrong (left), Miami, and C. J. Caraballo, Tampa, Florida, attend the annual meeting of the Southern Academy of Periodontology in Atlanta, Georgia.

Left: T. E. Braly (center), of Chattanooga, Tennessee, newly elected President of the Southern Academy of Periodontology, receives the good wishes of the retiring President, Hunter S. Allen, of Birmingham, Alabama. President-Elect R. P. Taylor, Jr., is on the right.

Above: Left to right: R. W. McNulty, Dean of Chicago College of Dental Surgery, Loyola University, Chicago; Roy J. Rinehart, Dean of the University of Kansas City School of Dentistry; Gerald D. Timmons, Dean of Temple University School of Dentistry; John P. Burke, Dean of the School of Dentistry, Georgetown University, Washington, D. C.; and J. Ben Robinson, Dean of the Baltimore College of Dental Surgery, University of Maryland, attend the dedication ceremonies at Temple University's new School of Dentistry.

Right above: Arnold D. A. Mason (left), President of the American Association of Dental Schools, confers with Leslie M. Fitz-Gerald, Dubuque, Iowa, at the Temple University School of Dentistry dedication program.

Right: Gustave Tassman, President of Temple University School of Dentistry Alumni Association, is toastmaster at the banquet held during the dedication ceremonies of the School's new facilities in Philadelphia.

Editorial Comment

"Give me the liberty to know, to utter, and to argue freely according to my conscience above all liberties." John Milton

ANYBODY'S GUESS

THERE IS NO telling how much longer the present boom and inflationary high prices will last. We are overdue for the recession that always follows a war. The artificial stimulants such as the European Recovery Plan and the normal impetus to business that comes from catching up on scarcities that resulted from the war, have kept our economy stimulated for the last two years. With heavy expenditures for defense, the present inflationary phase may be supported for several more years. Then, again, it may not be. Buyers' resistance has begun to show in some fields. This may lead quickly to falling prices and business uneasiness.

Dentists are in business. They profit during periods of full employment and meet economic reverses in times of recession. During the war there was a scarcity of dentists, a heavy demand for dental services, and large sums of money in circulation. Dental services were in boom demand and dentists, in common with other producers, enjoyed a prosperity and likewise developed some bad business habits.

Let us look at some of these bad habits. They include supercilious and independent attitudes that grew out of appointment books filled three or four months in advance. They include laxness in applying credit studies to dental patients. They include undue emphasis on expensive prosthetic services and indifference to the important and less expensive operative services. They include an inattention to individual patient education and case presentation.

Dentists who during the war and inflationary years ignored their courtesy and made it plain to patients that their sole interest was in "big cases" may now expect a falling off in patronage. Many people are now beginning to deliberate before they contract for several hundred dollars for prosthetic appliances.

Money for dental care is not as plentiful as it was several years ago. This is no occasion for panic. It is a time, however, for us to examine

our practice habits and our business procedures. There is still a fine living to be made by a dentist who concentrates on the simple business virtues of courtesy, service, careful case presentation, credit analysis, and hard work. The "take-it-or-leave-it" attitude, the excessively high fees, the brusque and unwholesomely independent manner should have no place in present dental practices.

Business in general has found that, with a return to competitive situations, it is necessary to do a more vigorous job of selling. It has been hard for some businessmen to make this adjustment. Anything could be sold during the war years. No effort was required and even ordinary courtesy was neglected. Business has now found that more attention must be given to promotion, selling, and civility. When we enter a period of recession, all the more vigor will be required; buyers' resistance requires more enterprise in selling rather than less.

The matter of collections will press to the forefront in the months ahead. Dentists have begun to notice that payments are not as prompt as they were a year or two ago. The practice of part-payment has returned. Patients who paid promptly and in full are now slower and are paying by installments. Unless the dentist keeps close attention to his accounting, he may not have noticed this subtle change that is occurring in the paying habits of his patients. The ideal dental practice is the one that is on a cash payment basis. Such an arrangement is not always feasible. If we are required to extend credit, we should try to do so on the same basis as business organizations; and that includes a collection system as realistic as that followed in business.

Although dental services are not sold by advertising, radio programs, or salesmen—nor should they be—the fact is that the dentist must give closer attention to patient education. As buyers' resistance is felt, it is more necessary for the dentist to concentrate on his individual case presentation. The dentist who has fallen into slovenly business habits and has neglected his interpersonal relationships needs to make a self-inventory if he expects to succeed in a period of recession.

It is anybody's guess when the recession will begin and how severe it will be. It is wise to arrange our affairs to meet it now. What is needed is prudence, not panic.

Seven Steps for Jacket Crown Preparation With Seven Diamond Instruments

By SIEGFRIED GRUENWALD, D.D.S.

Use diamond disk. Start about $1\frac{1}{2}$ mm. from proximo-incisal angle, holding disk slightly inclined toward the axial midline. Mesial and distal shoulders are started.

Diamond stone is used to reduce incisal edge enough to allow sufficient body for jacket crown. Cut in such an angle that the incisal bevel will be at right angle to the masti-

catory force of the opposing teeth.

Use the diamond shoulder cutter and lead the shoulder labially and lingually.

Remove the bulk of the tooth on labial and lingual to the depth of the previous step. This depth serves as a guide in cutting the labial and lingual surfaces.

Use a diamond instrument with cutting surface on the edge only, in order to straighten out shoulder in interproximal. This instrument will carry the shoulder under the free

gingival margin interproximally.

Carry the shoulder under the free margin of the gingiva with an end-cutting diamond instrument.

Round off the edges on the lingual and labial with a cone-shaped diamond stone.

Readers are invited to submit techniques to this department, and to request techniques in which they are particularly interested. Write to Dr. W. Earle Craig, care ORAL HYGIENE, 1005 Liberty Avenue, Pittsburgh 22, Pennsylvania.

THE COVER

OUR COVER this month is dedicated to the Greater New York Dental Meeting which will be held at the Hotel Pennsylvania in New York City December 6-10. The photograph is a typical New York City scene. The Chrysler Building is on the right.

SANFORD FELLOWSHIP PRESENTS CALIFORNIA CLINICIAN

UNDER THE sponsorship of the Herbert Orin Sanford Fellowship Doctor J. Donald Shriber, Los Angeles dentist, will appear in a one-day lecture program on November 11, 1948, at the Hotel Utah, Salt Lake City, Utah. He will present detailed discussions on his special field of research, nutrition-biochemical-endocrine factors in the diagnosis and treatment of oral diseases; concluding with a talk on "Psychosomatic Considerations for the Dentist." R. C. Dagleish, D.D.S., of Salt Lake City will preside. The Fellowship has been established by Mrs. H. O. Sanford in memory of her late husband in order to bring recognized lecturers and clinicians before dentists of the intermountain section of the West.

Ask Oral Hygiene

Please communicate directly with the department Editors, V. Clyde Smedley, D.D.S., and George R. Warner, M.D., D.D.S., 1206 Republic Building, Denver, Colorado, enclosing postage for a personal reply.

Desquamative Gingivitis

Q.—One of my patients, a woman about fifty-eight years old, presented with an inflammation of the labial gingivae and mucous membrane extending from the upper left central to the right cuspid area, and also on the mucous membrane of her lip in the corresponding area. Her lip was also rather swollen. The area is extremely sensitive and bleeds easily; especially at the gingival margins. She has had this condition for about a year and a half. Sometimes it almost disappears and then it becomes acute again.

Her mouth is well kept and her teeth are in good condition. There are no pockets and no gingivitis anywhere in her mouth. Occasionally the condition moves over a little to the left anterior area, but no other section is affected.

The patient otherwise seems in good health except possibly for nervousness. Her husband lost his position about the time that this condition started, and although they are not poor people, he has not been able to find what he wants yet.

She went to her physician who administered vitamin injections. She is now taking vitamin B by mouth.

I talked with her physician who diagnosed the case as gingivitis. Vitamin B and raw meat were advised. The patient refuses to eat raw meat, but takes the vitamin B. Her physician went into a discussion of "trench mouth" which he seemed to think the condition was. Isn't that the result of vitamin C deficiency?

I do not think it is acute ulcerative gingivitis. It appears to me to be what is called in the literature desquamative gingivitis that is treated with chloro-

phyll injections and chlorophyll locally or sometimes with estrogen.

From the description I gave, can you venture any information as to what it might be? I have been in practice twenty-six years and do not remember seeing a case like it.

If my diagnosis is correct, how would you treat the condition? What amount of chlorophyll do you inject and where?
—J. J. S., Illinois.

A.—The description of your case tallies closely with that of desquamative gingivitis, except that in the several cases of desquamative gingivitis that I have seen there has been no involvement of the mucous membrane of the lip.

Desquamative gingivitis usually occurs in the mouths of women at or near the change of life. The only treatment that has been offered as being effective is surgical removal of the membrane of the area involved. However, this treatment may not bring about a permanent cure. We have not used or heard of chlorophyll being used for this condition. As this condition does not occur in edentulous areas, the extraction of the teeth eliminates the disease.

What you say about the lip is indicative of herpes. However, I do not know of herpes involving the gingivae. Vincent's infection usually affects the septal crests of the gingivae, so your case probab-

ly is not Vincent's infection.—
GEORGE R. WARNER.

Balanced Occlusion

Q.—Will you please describe a good technique for balancing the occlusion on full dentures. I have been using articulating paper and abrasive paste in the mouth, but the results are not gratifying.

I have little difficulty with stability of the dentures, but certainly I have too many "sore spots," especially on the lower ridge.—C. M. E., Nebraska.

A.—In testing and correcting the occlusion, we use red disclosing wax. Paint the dried occlusal surfaces of the lower teeth with the wax, insert the dentures, moisten the occlusal surfaces of the upper teeth with the patient's saliva, and have the patient close gently with a tap-tap-tap action on the back teeth. Have him stop; remove the denture and examine the moment the wax is penetrated by a single cusp or more, if more than one happen to come in contact simultaneously. Grind the cusps or inclined planes, re-apply wax, and repeat the gentle tap-tap action, examine, grind, and repeat until contacts are quite evenly distributed. Then have the patient go into lateral and protrusive excursions, watching carefully that these excursions do not cause tilting or shifting of the denture bases. Continue this testing and grinding until occlusion is balanced in all occlusal positions.

After dentures have been worn from one year to several years, use disclosing wax to determine whether rebasing or making new dentures is indicated. I observe to what extent the wax is displaced under chewing pressure. If I judge that the necessary grinding to re-

balance the occlusion and provide the proper distribution of stress in the supporting tissue will shorten the bite too much or carry the lower anterior teeth too far forward, I then advise rebasing or re-making.

With the occlusion corrected, paint the tissue-bearing surface of the denture with the ivory disclosing wax and have the patient exert chewing stress on the teeth. Remove the denture carefully and examine for unequal displacement of the soft wax, grinding the bared areas with a large round bur. Repeat this procedure several times until you are satisfied that the stress on the supporting tissue is properly distributed. Remove the wax by wiping with cleansing tissue or by scrubbing with a denture brush, soap, and warm water. Carefully polish all ground surfaces before dismissing the patient.—V. CLYDE SMEDLEY.

Degenerating Pulp

Q.—I have a case which has me puzzled as to the correct procedure for the patient's welfare. The patient, a woman, came to me to have all her teeth removed as she has a chronic rheumatic condition in her hip, a blurring of the left eye with a couple of complete "blackouts," and the knuckles of her hands look arthritic but her physicians call the condition synovitis.

Her teeth are well kept. Her gingivae are so healthy and strong, exceptionally so for her age of 63, that, upon my examination of the roentgenograms which she brought with her, I recommended that we restore an upper central incisor, remove the upper right second bicuspid and molar, and a little later make her an upper and lower restoration. All these teeth gave a good response for vitality, even the upper left cuspid which I questioned.

When I removed the two teeth, I broke them open and found that the

pulps were inflamed and liquefied and easily broken apart. The chamber was small with no putrescence, but I did not like the "bloodshot" appearance of the pulp itself. I wonder if I should not remove the other teeth.—G. W. V., Utah.

A.—The case presented in your letter is one of our problem cases. However, your findings in the pulp chambers of the two teeth which you extracted are in line with cases which I reported in 1941.¹

We find degenerating pulps in a certain percentage of cases in which secondary dentine has reduced the lumen of the pulp canals enough to interfere with normal circulation in the pulps. One may obtain a positive response from an electric pulp tester² even after a pulp has become putrescent.

From your findings in the teeth extracted I believe it would be unsafe to leave any of the maxillary teeth in the mouth. There is a root tip on the left side of the maxilla that is probably infected.

One is more hesitant about removing all the mandibular teeth because of the greater difficulty replacing them. But if you remove the maxillary teeth and, upon opening them, find pathologic pulps, you would be justified in removing the mandibular teeth.—GEORGE R. WARNER.

Denture Adjustments

With regard to your reply on

denture adjustments³ to correct a whistling sound, I should like to offer further comment. You mention a method of modifying the contour of the anterior palatal surface against which the tongue plays. I have used a similar routine as follows:

Apply a wash material (I prefer one of the zinc-oxide pastes) to the area just posterior to the anterior six teeth. Then have the patient speak some of the linguodental consonants—d, g, h, j, l, n, t—as in the words "don't, George, hill, jug, lily, no, and tat"; followed by swallowing. Do not have him pronounce "s" sounds.

Another factor contributing to the whistling is the improper placement, vertically and anteroposteriorly, of the upper incisal edges in relation to the upper lip. You will notice an imperfect, slushy result in these sounds if the patient must use the upper lip rather than the incisal edge to control the rush of air (also with the "f" and "v" sounds).

You will appreciate these values more if you will make these sounds slowly and study the action and location of your tongue tip.

While our alphabet contains twenty-six characters, we use fifty-nine sounds, in common with all other languages. The lips, tongue, and teeth bear definite relations to each other to produce these sounds correctly; conjointly with the palate contour, throat form, resonance cavities.

The technique using the paste thus with speech was developed in the case of a preacher for whom I

IMMOBILIZED

SHE
BROKE A
DENTURE
TOOTH!

She cannot eat what she likes . . . cannot speak as accustomed . . . dares not smile (even if she feels like it). Her way of life—as well as her mouth—is immobilized for a day, two or three while that little denture tooth is replaced!

Nearly 40% of all routine denture repairs result from chipped and broken teeth. **Of these, more than 99% are brittle, hard porcelain teeth**—less than 1% are resilient, tough Denta Pearls.

The practice-damaging elements of risk (porcelain breakage) . . . of embarrassment . . . of impaired function . . . are reduced to the vanishing point when Denta Pearl "Cyclo-Mold" teeth are used.

JUSTI

Products for Better Dentistry

H. D. JUSTI & SON, INC., PHILADELPHIA 4

built new dentures after he had used an old upper denture for many years. The new denture with vertical dimension restored gave him a different anteropallatal contour, more deeply concave. This technique (build in) restored what he was accustomed to and his delivery difficulties were eliminated.

I would suggest that you try this technique on your next patient for whom you are restoring vertical dimension. First dentures do not require such restoration because the palatal contour has not been lost.—ROBERT R. GILLIS, D.D.S., 134 Rimbach Street, Hammond, Indiana.

safety base makes this film easier to read

The blue safety base of Du Pont Dental X-ray Film is a feature originated by Du Pont research. It produces radiographs of exceptional brilliance and clarity . . . facilitating quick, accurate diagnoses.

Another feature is the exclusive "Pull-a-Tab" packet. Simplifies handling the film in the darkroom . . . eliminates errors . . . and prevents injury to finger nails.

Du Pont Dental X-ray Film has optimum speed . . . high contrast and wide latitude. Round corners of saliva-proof packets make the film easy to position in the mouth.

Try this fine film. It comes in packages of 24 and 144—single- or double-coated—and is available through authorized dental supply dealers everywhere. Write for 32-page handbook "Better Dental Radiographs."

(Listen to "Cavalcade of America"
—Monday evenings—NBC)

Laffodontia

Running after women never hurt anybody—it's the catching them that does the damage.

★

The Texas-born captain of an all-Texas company in North Africa told his men:

"Our job here is to promote good neighborliness among other things. We've got to humor the natives. If they say Africa is bigger than Texas, agree with them!"

★

Asylum Patient (meeting new superintendent): "Who are you?"

Superintendent: "Why, I'm in charge here now."

Asylum Patient: "Ha—it won't take them long to knock that out of you! I was Napoleon when I first came here."

★

British Sailor: "Big battleship? Why the flagship of our navy is so big, the captain has to go around the deck in his auto."

Yank Sailor: "Listen here, buddy. The kitchen in our flagship is so big the cook has to go through the Irish stew in a submarine to see if the potatoes are done."

★

The kindly minister to the four-year-old: "Do you know where bad little girls go?"

Four-year-old: "Yeah, everywhere."

★

"Did your boy friend try any monkey business last night?"

"I'll say he did, the big ape."

Customer: "My goodness, eggs are high."

Grocer: "Sure, part of the war program."

Customer: "How?"

Grocer: "All the hens are making shells."

★

"My husband has flat feet. Can I get a divorce for that?"

"Not unless his feet visit the wrong flat."

★

A writer of radio commercials entered a restaurant, called a waitress and said:

"Give me some ham, piping hot and fragrant with the pleasant aroma of cloves, brown sugar, and steaming sauce. Serve it between slices of brown and crackly-cruised bread. Draw me a cup of delicious, flavorful coffee and add to it some thick, rich cream."

The waitress shrugged, turned toward the kitchen and yelled:

"Smoked pig on rye and Java with."

★

Manager to applicant for a job: "But I couldn't find enough work to keep you busy."

Applicant: "You'd be surprised how little it takes t' keep me busy."

★

We liked the story of the two ambitious little fleas who worked hard, saved their money, and finally went out and bought their own dog.

★

Helen: "When is Dorothy thinking of getting married?"

Mary: "When isn't she?"

PATIENTS SAY:

(We are constantly receiving letters from users pointing out the benefits derived from STIM-U-DENTS, as indicated by the following.)

"Your amazing product, STIM-U-DENTS, has made quite an impression with me and some of my friends.

"Recently a dentist advised my wife and me to use STIM-U-DENTS for our soft, bleeding gums. He told me that I had quite a bad case of trench mouth—another dentist had previously told me that I might have to lose my teeth.

"However, we both used STIM-U-DENTS faithfully for about two or three weeks and found that all traces of the soft gums had completely disappeared. Naturally, we were so thrilled about the results that we told some of our friends; two or three of them were having the same trouble with their gums. They, also, are experiencing similar results."

Help your patients maintain healthy mouth conditions through the use of STIM-U-DENTS.

Send them please to your druggist for a retail package and note the improvement upon their very next visit. They will be aroused to a new interest in their teeth and be prompted to visit you more frequently.

Money is unimportant here!!

THIS is the Land of Cockaigne.

It's a wonderful place where the houses are built of cake, and the shops are eager to give you their merchandise for free.

Here, roast geese and other fowl wander about inviting folks to eat them. Here, buttered larks fall from the skies like manna.

Wonderful place, Cockaigne . . . this Land that's always free from want . . . where business cycles are unknown . . . where money is unnecessary.

Only trouble is you won't find this mythical place on any up-to-date map of the world.

We live in a land blessed with plenty—true enough. But the rub is that we will always need hard cash to buy the things we want.

You will need money to make a good down payment on a new home . . . to send the children to college when the time comes . . . or to keep well-supplied with fine food and little luxuries when it comes time to retire.

One of the best ways you can assure yourself that you *will* have the money you need for the things you want later in life is to *salt away some of the money you now earn in U. S. Savings Bonds.*

These Bonds are the safest in the world. And they make money for you. Each \$75 you save today will grow to \$100 in just 10 years.

So start saving now . . . the automatic way on the Payroll Savings Plan where you work, or buy them regularly through your bank or post office.

Land of Cockaigne (COCKAYNE). This is a modern artist's idea of that delightful paradise which was part of the folklore of Europeans many, many centuries ago.

AUTOMATIC SAVING IS SURE SAVING— U.S. SAVINGS BONDS

RAIN

What do they do in Louisville when it rains?

Of course, you know the pat answer to that old saw: "Let it rain!"

In every city in the land, wise processors of acrylic dentures

know that when the humidity rises or falls it is extremely

important to use VERNONITE GEL, the pre-mixed acrylic denture base that assures *harder, stronger, more uniform*

restorations on damp days or dry. Mechanically spatulated

at the factory under scientifically controlled conditions,

Vernonite Gel eliminates the chance effects encountered

in hand mixing, avoids the undesirable variations of temperature and moisture. Remember, "whether it's

cold, or whether it's hot, we'll have weather whether or not,"

and whatever it may bring, you'll have better

dentures because *you* specify Vernonite Gel.

PERMANENTLY!

A GOLD FOIL AFTER 57 YEARS OF SERVICE! COURTESY DR. M. B. CARTER.

Here's the secret—(5)

After 57 years, the Gold Foil shown above is still as good as the day it was inserted—still intact and sound! Only a Gold Foil can render such wonderful service because only a Gold Foil *interlocks* with the dentin, sealing the cavity *hermetically*, and then maintains this seal *unimpaired*!

One reason only a Gold Foil maintains its seal for life is that a Gold Foil is no alloy, no amalgam, no chemical compound, and so is free from shrinkage and expansion due to *reactions between component elements*. It's free also from alterations *thermally*. When it is expanded by

heat, the dentin yields; when it contracts, the dentin follows it back to position.

Virtual Constancy of Bulk is Reason #5 why only a Gold Foil can last for 57 years—even in the difficult mesial corner of an upper central!

For complete data about the many advantages of this wonderful material, simply mail the lower portion of this page with your card or letterhead to **Morgan, Hastings & Co.**, 2314 Market Street, Philadelphia 3, Pa.—Established 1820.

please!

Reflection Meter Test

Subjects were a group of 100 people from all walks of life who were regular users of various well-known dentifrices, both pastes and powders. A Reflection Meter directed a concentrated light against an anterior incisor of each person tested. An electronic photocell gave amplified readings in terms of percentage of reflection . . . measured against a fixed standard. Readings were taken 7 days *before* and for 14 days *after* the people switched to Calox.

Calox Proved Best Brightener

After 7 days of normal brushing with Calox, the teeth of the 100 people tested showed 38.8% brighter than before the use of Calox. Many cases showed definite improvement after no more than 2 brushings with Calox.

Impartial Evidence

This Reflection Meter Test was conducted, not by Calox, but by an independent, trustworthy, recognized laboratory . . . among people who had been regular users of many of the best-known and most popular dentifrices. We believe that because of its proven

brightening power and its especially fresh, clean flavor, your patients will find Calox a most efficient and pleasant dentifrice for regular home use.

Invitation For You

If you would like to try Calox and observe its action yourself, we should be happy to send you a full-size can with our compliments. Please use coupon.

Prolonged effect

in local mouth lesions

Bristol Crystalline Penicillin G Troches, plain and with benzocaine, are white in color, pleasantly flavored with peppermint. The benzocaine form will be found especially useful in the presence of painful, inflammatory mouth lesions. The formula includes 5 mg. of benzocaine per troche, which provides adequate local anesthetic effect with minimum numbing discomfort.

Penicillin troches are used with definite relief in *Vincent's angina*; *ulcerative, aphthous or desquamative stomatitis*; *hypertrophic or ulcerative gingivitis*; *inflammatory paradentosis*, and for *postoperative discomfort*.

BRISTOL CRYSTALLINE PENICILLIN G TROCHES are available in bottles of twenty, each troche containing 5000 units of Crystalline Sodium Penicillin G.

BRISTOL CRYSTALLINE PENICILLIN G TROCHES with Benzocaine are packaged in bottles of twenty, each troche containing 5000 units of Crystalline Sodium Penicillin G plus 5 mg. of benzocaine.

LABORATORIES INC. SYRACUSE, NEW YORK

he proof (for denture wearers) is in the chewing!

The pleasure of many acrylic denture patients in now being able to chew Dentyne Gum, freely and without fear of "sticking"—has been revealed to us in hundreds of spontaneous letters. Its apparently unique quality of non-adhesiveness, we are advised, is such as to make chewing gum a real delight. • This new-found ability to chew easily and naturally with Dentyne Gum is a definite aid to the many denture wearers who must relearn the art of mastication. Dentyne's extra resiliency and pleasant flavor also can be of material aid in assuring adequate masticatory training during the critical "breaking in" period. • Remember, at all times, Dentyne's delicious, long-lasting flavor provides pleasure and enjoyment.

In dentistry, on-target therapy is easy, rapid and effective when you use the POWDALATOR Insufflator. With this simple device you may spray sterile penicillin-sulfonamide powder directly into a post-extraction socket, along gum margins or on wounded surfaces for the prevention and treatment of infections. The sterile powder is readily absorbed, providing a high concentration of healing power exactly where it is needed. • The POWDALATOR Insufflator is quickly assembled, easy to use, requires no further sterilization. It consists of a special insufflator bulb with individual dosage tubes. The tubes have curved tips to facilitate spraying the powder into the socket. Each tube contains a mixture of three effective antibacterial substances—penicillin calcium 1000 units, sulfathiazole 0.125 Gm., and sulfanilamide 0.125 Gm. POWDALATOR sets include 20 dosage tubes and insufflator bulb. Complete sets are available now through your usual source of supply. ABBOTT LABORATORIES, NORTH CHICAGO, ILLINOIS.

UROLOCIDE

Urolocide is a potent new quaternary ammonium compound, equally effective for the cold disinfection of instruments or for local antisepsis in the mouth.

Practically non-toxic, and non-irritating to human tissues, Urolocide is rapidly bactericidal and fungicidal—in highest dilutions—against commonly encountered pathogens, both gram-positive and gram-negative.

It is odorless, tasteless and water-soluble, and indefinitely stable in solution, even when exposed to air.

Instruments are not affected by Urolocide since it contains neither phenolic, mercuric nor other corrosive ingredients.

*

*

*

Available in pure crystal form in packets of 3.8 Gm., sufficient to make 1 gallon of 1:1000 solution: the recommended concentration for instrument disinfection of local antisepsis. Also supplied in 8 oz. and 1 gal. bottles of Tincture 1:1000 and 1:500, and in Aqueous Solution 1:1000.

Reproduction at the

the Wernet Booklet
"Special Problems in
Denture Retention"
published for the
dental profession.

Special Problems in Denture Retention

Shrinking Alveolar Process

Inasmuch as denture stability is closely associated with well-defined ridges, frail alveolar ridge formation resulting from alveolar ridge resorption (or even complete resorption of the alveolar process), presents a progressively difficult problem in the construction of stable dentures. This problem is quite often aggravated by flabby, hypertrophied, yielding alveolar tissue falling over the area to be used as a denture foundation.²⁵ This condition may be either stationary or progressive, depending upon the rate of resorption which is affected by such factors as extraction trauma, denture pressure, neglected oral hygiene, failure of patient to report for adjustment at regular intervals, general systemic condition of patient, etc. In addition, the atrophic changes constantly occurring in the alveolar process present a continuing problem to the prosthodontist in maintaining satisfactory retention. This problem may be solved in great measure by judicious prescription of Wernet's Powder during the period of resorptive change.

FLABBY, YIELDING ALVEOLAR PROCESS: the atrophic changes constantly occurring in the alveolar process present a continual problem in denture retention and occlusion.

WERNET'S POWDER

Dear Doctor:

There is only one Aristaloy! The World's Finest Alloy. It cannot be even closely imitated.

Aristaloy has enabled you to put in dense amalgam fillings completely sealing the cavities, and has stayed clean and bright in the mouths of your patients for so many years only because of the definite shape, size and density of the carefully selected fine particles.

The complete modern manufacturing process including the patented elutriation system which rejects all dust and all unsatisfactory particles and accepts only the proper particles that you use, is entirely different from that used in the manufacture of any other alloy. The whole Aristaloy process is balanced to give you superior fillings with your technique.

Grinding a good alloy into dust will never produce anything like Aristaloy which, like our present filling porcelain, was developed through facing facts with years of research.

Please be assured of our desire to serve you through your dealer. However, if you have any difficulty in obtaining our products, we would appreciate your writing us.

Sincerely yours,

BAKER & CO., INC.

BASIC THERAPY for healthy

oral mucosa

Four vitamins are essential for the integrity of buccal mucosa. Three of them—thiamine, riboflavin and niacinamide—are members of the B complex; these, together with Vitamin C, are referred to as the “critical water soluble vitamins”.

When nutritional deficiencies are reflected in oral lesions, Basic Formula Vitamin Tablets Squibb provide:

Correction—of the deficiencies often associated with changes giving rise to gingivitis

Protection—when given prophylactically, or as an adjuvant to chemotherapy or antibiotic therapy of oral infections

Clinically proved, truly therapeutic dosages of

Thiamine Hydrochloride	10 mg.
Riboflavin	5 mg.
Niacinamide	150 mg.
Ascorbic Acid	150 mg.

Dosage: one or more Tablets daily

WHY BE CONTENT WITH COLD DISINFECTION?

Give your patients HARVEY protection

HARVEY

VAPOR PRESSURE
STERILIZER

The Harvey Vapor Pressure Sterilizer embodies the desirable characteristics of four methods of sterilization in one easy-to-use modern automatic sterilizer. This is an acknowledged fact, not a blue sky claim.

HARVEY protection is synonymous with complete and rapid sterilization. It is based upon the advanced principle of dry vapor sterilization . . . it is convenient, efficient, and desirable.

Harvey's Vapo-Steril Solution is a specially compounded alcohol base solution for use with the Harvey Sterilizer. It creates a gaseous vapor which covers every surface of the contents of the sterilizer, insuring complete and rapid Sterilization. Its cost is negligible.

LOOSE, JUMPY, WOBBLY!

Lost their precision. Can you do porcelain jacket work with your handpieces? You can, when we rebuild them, because they'll be like new. Our factory-trained mechanics remove all parts, start with the empty housing, and lap in the new parts to minute tolerances. We even manufacture our own parts, using the finest of steel to assure controlling the quality of our repairs. We realize our repairs have to be equal to

new handpieces to hold your business year after year.

BAKER

Unicast

C A S T I N G G O L D

So few people realize the great benefit derived directly or indirectly from the use of the six Platinum metals.

PLATINUM
IRIDIUM
OSMIUM
PALLADIUM
RUTHENIUM
RHODIUM

A rich gold color, non-tarnishing alloy at \$1.78 dwt, \$100 or Laboratory wholesale rate \$1.58 dwt.

Like Super Oralium, this is only possible because of its high Palladium content. Hundreds of Dentists use this gold daily, even for inlays, where economy is a factor.

Order a few dwts for trial. This alloy fascinates us. We ship thousands of ounces with never a complaint. You'll be pleasantly surprised.

MAN-WITH-THE-FACTS

READY TO HELP YOU!

**YOUR DENTAL DEALER
IS "UP" ON EVERY NEW AND PROVEN
DENTAL PRODUCT!**

Your Dental Dealer spends a major part of his day just finding facts about dental supplies and equipment.

For him, the Dental World is a live, changing, progressing thing. New equipment is daily being designed, put to test, re-designed, re-tested. The old "tried and true" products, too, are constantly improved—**ALL TO MAKE YOUR JOB EASIER.**

He follows it all. He's well-read. He's a faithful "conventioneer." He's in close touch with Dentist, Manufacturer and Laboratory.

Call on him at any time on any problem you have relating to equipment. His advice is without bias, and backed by FACTS!

RESTYLE YOUR WINDOWS

by John G. Shea *

To make a small single window seem spacious, use a room-width ceiling valance board and build in bookcases along the line of the sill. Complete the illusion by using oversize Venetian blinds and drapes spreading wide to cover the outside balance of exposed wall.

Two narrow windows draped and curtained as one with a large Venetian blind spanning both windows and the intervening wall, will produce a similar spacious effect.

Brighten your office with fresh greens and colors by lining the sills with real garden boxes.

Complement your windows with a smartly styled American Mobile Clipper Cabinet. It moves where you want it, for better window light and convenience of operation. The Mobile American Clipper brings efficiency and smartness to your office which will be appreciated by your patients—as well as yourself. Send in the coupon for more information.

Model No. 3A

Now . . . you can order this wonder electric-mortar-and-pestle and get delivery within thirty days. Although we have been making Wig-l-bugs in large numbers the demand has exceeded our supply for several years. Today, however, available materials and a stepped-up schedule permit our filling orders within a month.

The Wig-l-bug requires only 7 to 10 seconds to triturate enough amalgam for the average filling. It saves time, prevents waste, produces mixes with a smooth, fine texture. Use it with your preferred alloy.

TRI-TEX

POWDER AND LIQUID

For Rebasing "AT THE CHAIR"

TRI-TEX powder is a precured resin (methyl methacrylate). TRI-TEX liquid, the solvent for the powder, contains no chloroform, acetone or acrylic monomer.

TRI-TEX is easy to use. Simply mix to the consistency required when desired, apply to the denture and "seat" the denture "at the chair." This addition to the denture will set in about fifteen minutes, the final result being a hard, non-porous, acrylic correction which results in accurate adaptation to mouth tissue. When proper technique is employed, the TRI-TEX addition will become an integral part of the denture impossible to remove except by lathe grinding.

TRI-TEX has enjoyed professional acceptance for over 4 years.

Attractively packaged, befitting a product that is compounded at the chair in view of the patient.

Developed from the formula of

John A. Sears

dam the blood WITH Hemo-pak

In exodontia, stop bleeding immediately, and facilitate good clot formation, by lightly packing the socket with a strip of sterile Hemo-Pak gauze or cotton—J & J's amazingly effective new hemostatic absorbable surgical dressing. Use it dry, *just as it comes from the tube or bottle*. No further preparation or other hemostatic agents are required. Apply slight pressure for a moment or two—and watch the bleeding stop! Then forget it! It will be completely absorbed. In more extensive procedures, just cover the bleeding surface with Hemo-Pak if necessary, suturing in place or burying in the tissues (it is non-irritating).

Hemo-Pak is supplied in sterile, sealed tubes:

1. Hemostatic Absorbable Cotton Pads: 6" x 2".
2. Hemostatic Absorbable Gauze Packing Strips: ½" x 2½ yds.

Grand Prize
of
\$25,000
FOR SUGAR RESEARCH

TO STIMULATE independent inquiry into the potentialities of sucrose for food and non-food functions, the Sugar Research Foundation is sponsoring:

- A fourth intermediate prize of \$5,000 for the research project judged most significant in 1948.
- A grand prize of \$25,000, to be awarded in 1950 "for the most outstanding contribution of original knowledge concerning sugar made during the previous five-year period."

Three \$5,000 awards have been conferred to date for significant research which has advanced knowledge of the carbohydrates.

Prizes are administered by the National Science Fund of the National Academy of Sciences, and are independent of the Foundation's research program.

Entries for the Fourth Intermediate Prize should be mailed to the Executive Secretary, National Science Fund, 2101 Constitution Avenue, Washington 25 D.C., before January 1, 1949. Announcement of the prize winner will be made on or about April 1, 1949. Details and regulations governing the award may be obtained from the National Science Fund.

Where Spore Destruction is not a Consideration

Chlorophenyl

Affords a Valuable Instrument Disinfecting
Medium for WARD and PROFESSIONAL OFFICE Use

This powerful disinfecting solution is free from phenol (carbolic acid) and mercurials. It is a chlorinated phenyl compound that is unusually non-selective in its rapid destruction of commonly encountered vegetative bacteria as shown in the chart.

PRICE Per Gallon . . \$6.50
Per Quart . . \$2.25

Check these additional features—

- 1 Non-injurious to metallic instruments or keen surgical edges.
- 2 Low volatility . . . will not irritate eyes, nose or throat.
- 3 Will not stain fabrics, skin or tissue.
- 4 Will not dry and fissure hands or skin areas if exposed repeatedly. (Chlorophenyl is not to be used therapeutically.)
- 5 Stable . . . will retain potency over long periods.

B-P instrument container No. 300 is recommended as the ideal office container for use with the Solution.

Compare the killing time of this superior bactericidal agent

Vegetative Bacteria	10% Dried Blood	Without Blood
Staph. aureus	15 min.	2 min.
E. coli	15 min.	3 min.
Strept. hemolyticus	15 min.	15 sec.

BURN-OUT-PROOF!

A safety measure protecting
both sterilizer and instruments
featured exclusively in

AMERICAN

SMALL INSTRUMENT STERILIZERS

8 mechanical features of primary importance

- 1 **SIGNAL LIGHT**—A 6 watt lamp illuminates the red-cross bullseye when switch is on and unit is in operation.
- 2 **CONTROL SWITCH**—A Bakelite handle actuates hermetically sealed mercury switches. When switch is on, full heat is applied until water simmers, then heat automatically reduces to maintain mild boiling. If water depletes, all heat is cut off permanently.
- 3 **CONTROL ROD**, mounted in tension on sterilizing chamber, controls mercury switch with positive setting at boiling point or complete cut-off when chamber is dry.
- 4 **THERMOSTATIC CONTROL**—Instead of bi-metal thermostats, the mercury switches are controlled off and on through the control rod by the expansion and contraction of the sterilizer chamber.
- 5 **STERILIZING CHAMBER**—A one-piece bronze casting. Cover and finishing jacket of polished stainless steel.
- 6 **HEATERS**—There are two elements, refractory cement embedded, chromium steel clad . . . a more durable construction designed for dry burning such as laundry type flat iron service.
- 7 **CONDUCTOR CORD**—Six foot length of heater cord with moulded rubber plug attachment for electric outlet. All component units are approved by the National Board of Fire Underwriters.
- 8 **MERCURY SWITCHES**—There are two hermetically sealed mercury tubes, safe in the presence of explosive gases, and fully reliable when operated on either alternating or direct current.

PORTABLE MODELS

available in three practical sizes

MODEL A-414 — Size 4" x 6" x 14"

MODEL A-416 — Size 4" x 6" x 16"

MODEL A-617 — Size 6" x 8" x 17"

The "American" Small Instrument Sterilizer provides automatic "burn-out-proof" safety. If water becomes exhausted below the critical level, a complete automatic cut-off of current occurs. Functional operation can only be resumed by replenishing water in the chamber and manually switching on the current again.

LOW-ABRASIVE POLISHING AGENTS

in

Pepsodent Tooth Paste

Laboratory tests show that Pepsodent Tooth Paste is one of the least abrasive dentifrices on the market. Pepsodent owes its low abrasive properties mainly to its unique combination of polishing agents. This combination contains a patented ingredient that makes its use in a dentifrice exclusively Pepsodent's.

Even with low-abrasive ingredients, however, a system of rigid manufacturing controls is essential to the production of a completely safe dentifrice. Pepsodent ingredients are checked constantly to insure uniformity. Every shipment of raw materials for the polishing compound is tested for fineness of particles, for abrasiveness, and for purity. When the paste is finished it undergoes another series of careful tests.

You can recommend Pepsodent Tooth Paste as a completely safe dentifrice — with full confidence that its low-abrasive properties will be maintained by Pepsodent's rigid manufacturing controls.

PEPSODENT DIVISION OF LEVER BROTHERS COMPANY

npc

Novocain-Pontocaine-Cobefrin

Cobefrin, Novocain, Pontocaine, Np. Trademarks Winthrop-Chance, Inc.

Difference is Distinctive

but what has "N.P.C." to do with the beauty of a porcelain jacket crown restoration?

Years before use of Novocain-Pontocaine-Cobefrin became routine in operative procedures, one of the old masters of porcelain jacket crown work, in describing his preparatory technique, wrote:

"The first step, after the patient has been properly anesthetized, . . . is to reduce the length of the tooth by removing the incisal enamel."

"After the patient has been properly anesthetized" — note that. Even in those days, when patients were expected to "take it," this dentist realized that for a perfect preparation and a perfect restoration he needed time and a calm, relaxed patient.

How he would have appreciated Novocain-Pontocaine-Cobefrin and its deep, dense, long-lasting anesthesia, without increased vasoconstriction or perceptibly decreased patient tolerance! In operative procedures where pain or discomfort is probable, let your first step be . . . *Anesthetize with "N.P.C."*

Pain Relief in Vincent's

Pain caused by Vincent's Infection is usually relieved within 24 hours -- after a maintained course of Cutter PEN-TROCHES* is started. Healing is progressive and smears become negative in typical cases.

Prescribed for prophylaxis following routine dental procedures --

PEN-TROCHES -- Crystalline Penicillin G (Potassium) -- also provide a convenient method of sustained treatment for other infections of the oral cavity, caused by penicillin sensitive organisms. PEN-TROCHE therapy controls bacterial growth and allows healing to continue unimpeded.

Available in moisture-proof vials or in bulk -- in 1000 or 5000 units.

*CUTTER trade name for penicillin troches

DO PATIENTS FOLLOW YOUR ADVICE IN REGARD TO SMOKING?

Many patients find it difficult to give up
smoking — even when you might deem it advisable
because of cigarette-smoke irritants.
In such cases, "Change to Philip Morris"
is a well indicated alternative.

Philip Morris of *all* cigarettes, is the *only* one
proved* definitely and measurably
less irritating. Actually, the wisest choice
for everyone who smokes!

Philip Morris & Co., Ltd., Inc.
119 Fifth Avenue, N. Y.

IF YOU SMOKE A PIPE . . . We suggest an unusually fine new
blend — Country Doctor Pipe Mixture. Made by the same
process as used in the manufacture of Philip Morris Cigarettes.

*Reprint on Request: Proc. Soc. Exp. Biol. and Med., 1934, 32-241.

Outstanding!

IN PERFORMANCE . . IN DURABILITY

AND NOW

CUTWELL *Tri Bond* DIAMOND INSTRUMENTS

In the TriBond Process, used only in the production of Cutwell instruments, the sharp-edged diamond particles are *triple bonded* to the tungsten-steel base in a medium that becomes virtually integral with the steel itself, affording by far the most positive protection known against dislodgment or "peeling". Yet the actual depth of the bond is so slight that smaller diamond particles can be used than in other bonding processes, which means smoother cutting, with minimum "scoring" . . . On top of these advantages, remember—only Cutwell Diamond Instruments cut as well on the sharp angles and extreme edges as on the broader surfaces.

R&R

Extra Value!

CUTWELL DIAMOND INSTRUMENT ASSORTMENT No. 6

\$23.35

TWO ASSORTMENTS

\$4350

HANDY HOLDER, TOO!

An attractive 36-hole Bakelite instrument holder is included in the No. 6 Assortment without extra charge.

You Can See the Difference

HERE

THESE ARE THE SIX TYPES INCLUDED IN STANDARD ASSORTMENT

If other types are desired, they may be substituted for any of these with a proportionate saving from individual instrument prices.

Note this **GUARANTEE!**

Cutwell Diamond Instruments are designed for use on natural teeth, and when used only for that purpose are unconditionally guaranteed against breakage, peeling, or unsatisfactory performance.

Comparison under even a low-power magnifying glass will show clearly that the deposition of diamonds on Cutwell Diamond Instruments is as dense and uniform over the sharpest angles, and at the extreme edges, as on the rest of the surface. This is an *exclusive* advantage of the TriBond Process.

THE RANSOM & RANDOLPH CO., Toledo, Ohio

AN EFFICIENT LAB BENCH FOR PRACTICAL DENTISTS

A symbol of beauty plus life-time durability, the *Tech-Bench* offers many unique and outstanding features . . . Eighteen spill proof drawers that never stick or jam . . . ORA *Denture*

Members of the dental profession in all parts of the country have used Ora Denture Cleanser, have satisfied themselves that it is a superior compound, and have recommended it to their patients. The following excerpts from thousands of their letters are typical:

ORA *does these things... BETTER!*

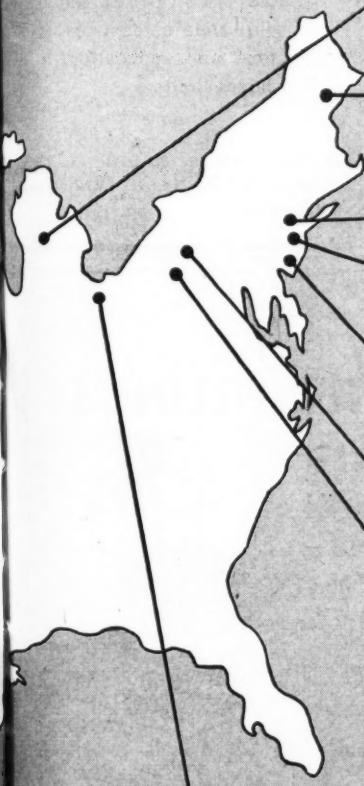

1. Makes dentures immaculately clean.
2. Removes stains, prevents stains if used routinely.
3. Dissolves mucin and mucin plaques.
4. Prevents offensive breath due to denture not being thoroughly clean.

No Brushing. Just immerse denture in Ora solution for 15 minutes, or overnight.

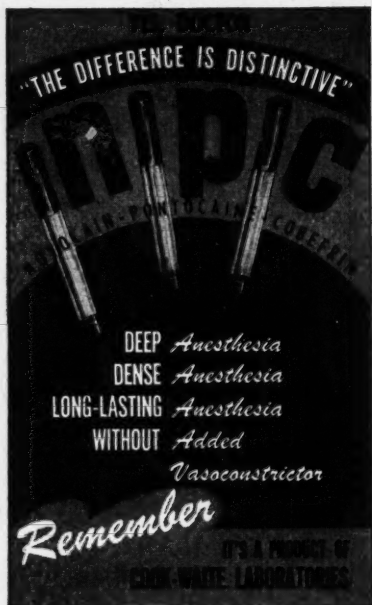

ORA is guaranteed not to injure denture
McKESSON & ROBBINS, INCORPORATED, BRIDGEPORT, CONN.

when you recommend *Cleanser*

- 
- (OKLAHOMA) "Ora is really wonderful... I haven't found its equal in any other preparation."
- (MICHIGAN) "My dentures were covered with a brown stain. I tried Ora after trying everything else, and now they look as clean and pink as when I first got them."
- (MAINE) "...not only makes my teeth clean and bright, but seems to give my mouth such a relieved feeling."
- (NEW YORK) "It does a perfect job of removing nicotine stains."
- (NEW YORK) "My husband has one of the old-fashioned plates and it was all stained up... well, you should have seen all the stains come off, and how white the teeth became."
- (NEW JERSEY) "I have never used anything nearly so good... my mouth feels so clean and refreshed."
- (PENNSYLVANIA) "The best false teeth cleanser I have ever used."
- (PENNSYLVANIA) "I gave my dentures an overnight bath and all the stains were gone in the morning... my plates looked brand new."
- (OHIO) "I have worn plates many years, and Ora is the most satisfactory cleanser I have found."

Minimax alloy

A murky gray fog spreads inland — an impenetrable pall that blots out the sun and brings chill to the very marrow — another example of Nature's destructive forces.

It smothers the coast for hundreds of miles, obscuring vision, menacing navigation, halting transportation, creating confusion.

A grave source of uncertainty in amalgam work are the unavoidable variables encountered in mixing, packing and polishing . . . Variations caused by the fact that no two cavities have the same size, the same shape nor have the same accessibility and no two dentists manipulate amalgam exactly the same way.

To resist these "unavoidables" and still make lustrous, lasting fillings use Minimax Alloy No. 178 — the alloy that is fabricated to permit wide leeway in manipulations, to comply with ALL specifications where compliance means most . . . in your hands using your preferred technic. Buy Minimax with confidence, use it with success.

*Minimax Alloy
complies with A.D.A.
Specifications No. 1
Filling suitable for
allay-inlay work.*

The MINIMAX Co.
5905 N. Clark St.
Chicago 26, Ill.

For best results, mortars and pestles should be used with care. Over long periods, they wear smooth . . . become inefficient. As a convenience, Minimax provides FREE with every bottle a handy package of Abrasive Restoring Powder.

Celebrating Our 40th Anniversary

Successful treatment in hypochromic anemias calls for more than just iron salts: the vitamins and liver, combined with iron have been found effective adjuvants in restoring a normal blood picture. Hemosules† Warner include not only adequate quantities of ferrous iron salts but also substantial, well-balanced amounts of the B-complex vitamins including folic acid—all of which have been found important in the regeneration of red blood cells.

“WARNER”

Hemosules†

which are reasonably priced, will prove of benefit for patients who are “run down” or underweight and also for those who require a “pick up” during convalescence from infectious diseases.

*The minimum daily requirement for niacinamide has not been established.

**The need for pyridoxine hydrochloride, calcium pantothenate and folic acid in human nutrition has not been established.

†Trademark

Packaging: Hemosules† Warner—benzoin capsules—are available in bottles of 96 and 250.

Hu-Friedy Forceps With Their Heritage of Quality and Efficiency

The forceps illustrated on this page have been designed and constructed in collaboration with authorities of oral surgeons and general practitioners and have been acknowledged as the most outstanding in their efficiency.

The beaks of all the forceps illustrated are built to fit the convexity of the root and eliminating contact with the crown of the tooth. The beaks will fit the topography of the root over a larger area, thereby distributing the pressure which will avoid breakage of the tooth. The two point contact has been eliminated.

Manufactured of *Immunity Steel*, properly balanced to reduce weight. The handles are so designed to render a firm and comfortable grip.

Other numbers available in addition to those illustrated are Nos. 150A, 151A, 62P, 214, 215, 6, 7 and 112.

Available through all dental supply houses.

Eliminate FRICTIONAL HEAT

DURING CAVITY
PREPARATION

with

THERM-Ex

PATENT PENDING

SPRAY

PATIENT OPERATED: That much desired psychological distraction from the operation is provided by allowing the patient to control the Therm-Ex Spray by pressing air cut-off when sensing pain or as directed.

FACTS established in many thousands of offices

Therm-Ex ejects an atomized water spray which continuously cools bur, diamond point, stone or disc — keeps these clean and sharp — flushes the cavity of debris — affords clear visibility at all times — does not flood the mouth — is readily adjusted to emit air only by the turn of a valve — is wonderfully simple for dentist and patient.

Therm-Ex practically eliminates the pain caused by frictional heat created by the rotating tool—local anesthesia is unnecessary in most cases.

Therm-Ex prevents permanent injury to tooth structure by permitting patient to indicate when danger areas are reached—reduces operating time to half. Patients request the use of Therm-Ex because it makes them so much more comfortable.

Therm-Ex is a boon to dentistry. Ask your dealer or write for FREE literature.

The Therm-Ex atomizer attached to your spray bottle is adjustable for air only or a saturated water spray. Rubber tubing connects atomizer with spray attachment.

The illustrations at right show...

1 Therm-Ex Spray attached to a straight handpiece and

2 The Therm-Ex Spray attachment snapped to contra-angle.

THERM-Ex Does Not Require Special Connections or Equipment

*"I take one
Ce-De-Flor®
tablet
each morning
when I brush
my teeth"*

SHE'S A WISE MISS ...and so is her dentist or physician

• In communities where drinking water lacks sufficient fluorine content, incidence of dental caries runs high... particularly in children. In such communities, rate of dental caries incidence may be materially reduced by the regular use of Haack's Ce-De-Flor tablets.

Today Dentists and Physicians prescribe Ce-De-Flor tablets between topical applications to supplement the fluorine content of water. Palatable, easy-to-take Ce-De-Flor tablets are particularly recommended for children 6 to 16. *Dosage:* one tablet daily as directed by Dentist or Physician. Supplied on prescription only. Literature and samples on request.

FORMULA: Each Ce-De-Flor tablet contains 30 mgm. vitamin C, 1000 units vitamin D, 3 mgm. calcium fluoride

 Christmas
 Seals

YES!

There is a Santa Claus

... and the genial old gent has commissioned us to make it easy for you to fill up that Christmas stocking.

Take a few moments and look around. You will be surprised to find that you have quite an accumulation of scrap gold . . . old crowns, inlays, fixed and removable bridges, etc.

No fuss or bother . . . just make an "as-is" package of it . . . ship it, direct or through your dealer, to the Dee Division of Handy & Harman . . . and back to you will come DOLLARS for Yuletide spending.

The experience, reputation, and modern refining methods of this leading organization constitute a guarantee that the final fraction of value in your shipment will be reclaimed.

Let's get together for a "bumper" Christmas stocking.

**SEND FOR FREE SAMPLES OF
CLOVER LEAF IMPRESSION PLASTER
and CLOVER LEAF HARDITE**

Clover Leaf Impression Plaster is unsurpassed for making accurate impressions that faithfully reproduce every detail of teeth and tissue. Its rapid, accurate set saves valuable time, it breaks with a clean fracture and eliminates distortion.

Hardite reproduces the minute detail of the impression and holds the case to unchanging dimensions regardless of the temperature at which it is cured. Manufactured under strict laboratory controls, Hardite provides consistent uniformity of all properties essential to accurate fit and articulation.

better teeth

through improved nutrition...

The significance of nutrition in tooth health and development⁴ is receiving increasing clinical evaluation—especially the need for adequate vitamin C.

Today, vitamin C is known to be “vitally important to the integrity of the forming and growing tooth.”² It is essential in the production and regulation of intercellular substance⁶... in the integrity of dentin, pulp, cementum and enamel³... and is a prerequisite for sound odontoblastic formation.⁴

Healthy gingivae⁴ require regular, ample amounts of this important vitamin, too—found in such generous abundance in Florida citrus fruits* and juices (fresh or canned). Additionally, their inhibitory action on bacterial flora in the mouth¹ and their excellent mechanical detergent qualities⁵ assist materially in improving oral hygiene.

FLORIDA CITRUS COMMISSION
LAKELAND, FLORIDA

**Citrus fruits are among the richest known sources of vitamin C; they also contain vitamins A, B₁, G and P; iron, calcium, citrates, citric acid and fruit sugars.*

DENTAL PRODUCTS

7414 GREENWOOD AVE. — CHICAGO 17, ILLINOIS

the **EYE**
that
guides
the
hand
that
heals

Cautiously, skillfully, you use instruments and mirror to find trouble in the mouth of your patient. But when danger flashes, human eye and hand may not always be able to reveal the trouble.

A General Electric CDX dental x-ray unit shows you the facts. Slide it quickly into position. Sight along the head. Only with a G-E CDX can you get an unobstructed view of the operation field. Within minutes, brilliant pictures will guide your judgment.

As a leader in dental, medical and therapeutic x-ray development, General Electric combines continuous x-ray research with G-E standards of dependability. The G-E name on your dental CDX unit is the symbol of precision, efficiency, and the scientific security you need for all types of x-ray work.

You can sight along this tube

CDX—Safe—Shockproof—X-ray protective

Brilliant diagnostic radiographs are assured with the G-E Coolidge dental x-ray tube, utilizing an extremely small projected focal spot. Correct focal-film distance is automatically set by centering cone. Exclusive Kearsley Stabilizer controls milliamperage, for consistent picture density. Weather, altitude and dust can't penetrate the shockproof, hermetically sealed container guarding all high-voltage parts. For easy maneuverability to difficult angulations, tube head rotates mesially or distally through 360° arc vertically, and 290° arc horizontally. Stationary and Mobile types. For illustrated booklet, write: General Electric X-Ray Corp., Dept. K-3, 4855 McGeoch Ave., Milwaukee 14, Wisc.

GENERAL  ELECTRIC
X-RAY

General Electric X-Ray Corporation manufactures and distributes x-ray apparatus for dental, medical and industrial use; electromedical apparatus; and x-ray and electromedical supplies and accessories.

AT LAST!

AN INLAY WAX THAT DOES NOT
EXPAND OR CONTRACT

*

* Again Dr. A. E. Peck has made a major contribution to the dental profession... an inlay wax that does not expand or contract—that enables you to get an exact cavity reproduction. Our Purple Hard inlay wax—famous for years—and now so greatly improved, saves time, effort, and assures top quality work. Dr. Peck says, "With 35 years experience in manufacturing wax, I am now able to mix a wax that when poured into a vat, leaves a smooth regular surface upon cooling. This means accurate castings, better fitting inlays. Any undercuts will show on the pattern. Simply cut these protrusions off and re-adapt pattern to cavity for near-perfect accuracy."

Signed—

I LOVE *You* TRULY

"I have had several compliments on the "Histacount" and have recommended it to several doctors. And, I appreciated it most of all when I filed my income tax report. The federal tax man said it was the finest, most complete little outfit he had ever come in contact with - - - quite a compliment, I thought." April 28, 1948

Dr. C. R. COLLINS, 112 N. Indiana Street, Warsaw, Indiana

*The HISTACOUNT System

What the federal tax man told Dr. C. R. Collins** is what every expert accountant says. It's what thousands of doctors say who have used "Histacount" five, ten or more years, and what they put into similar little "from the heart" notes with each re-order. You'll feel the same way once you use "Histacount".

**Dr. C. R. Collins is a real live doctor and he wrote the above to us without solicitation. It is only one of MANY hundreds such letters.

HISTACOUNT IS ALSO AVAILABLE AT
YOUR LOCAL SUPPLY HOUSE

A Most Interesting FREE BOOKLET

It tells the "Histacount" story in words and pictures; it will eliminate bookkeeping and tax problems; tells you your financial status at all times; what you earn, collect, spend. You'll be amazed at what "Histacount" can do for you; how easily, with what little work and for how little money.

Important progress in the practice of daily oral hygiene

Neutrox combines for the first time, the benefits of *active oxygen* with polishing agents in a form *safe for daily home use*.

As a Daily Dentifrice, Neutrox actually helps the tooth brush do a better job . . . remove surface stains from the teeth . . . improve gingival tone . . . leave the mouth in a cleaner, healthier condition.

As a Therapeutic Home Rinse to supplement your office care of gingival infections, Neutrox provides more oxygen than sodium perborate, USP, in *non-irritating* solution (no alkali burn).

Now More Than One Million Packages have been distributed . . . all as a result of original prescriptions or recommendations of dentists. *Your patients* would probably appreciate knowing about it, too.

Densene "33".

for your resi

The accuracy of Densene "33" permits precision molding! That's why it is the only resin that is consistently successful in partial restorations. Because it molds accurately and retains its molded form in mouth service, no breakage, malocclusion or traumatization of ridges can be caused through warpage and distortion.

cast-metal-accuracy" full and partial cases.

No other resin approaches the "cast-metal-accuracy" of
Densene "33," throughout processing and mouth service. It
molds perfectly and *retains its molded form.*

Internal stresses which ordinarily cause warpage and
distortion are *controlled for*
release during cure . . .
before case is removed
from flask!

Obviously, it is the
ideal denture material
to safeguard the re-
tentive resin-to-tissue
fit of your full and
partial dentures.

One of the largest and most reputable laboratories in
the country reported an average of only one remake
for each 750 Densene "33" partial cases produced
during the last year!

10c per word, initials and figures used each counting as one word. Please send remittance with your order.

WANT ADS

Restricted to help positions wanted, practices wanted, practices for sale. The minimum charge is

FOR SALE: Two-chair completely equipped office and very lucrative practice in Dayton, Ohio. Established thirty years. Many unusual features; just refurbished and decorated. Excellent fees. Will bear strictest investigation. "554" Oral Hygiene, Pittsburgh, Pa.

WANTED: Experienced dental laboratory technician to serve four to eight dentists in central New York. Laboratory completely new. For complete details write Dr. Ralph B. Nash, Newark, New York.

POSITION DESIRED by technician experienced in porcelain jackets, gold inlays, posterior fixed bridges, and some acrylic work. "555" Oral Hygiene, Pittsburgh, Pa.

FOR SALE: Combined residence and fully equipped dental office including x-ray and gas. Established ten years in Illinois town of two thousand. Excellent surrounding territory. Leaving to specialize. No reasonable offer refused. "556" Oral Hygiene, Pittsburgh, Pa.

FOR SALE: Practice, equipment and supplies at inventory. Established in Iowa town forty-six years in same location; two thousand population. Reasonable rent. Retiring. "557" Oral Hygiene, Pittsburgh, Pa.

WANTED: Dentist in established practice, extractions, plate work, removables; in city of one hundred twenty thousand population. Associate or partner. Nothing to buy. Should net one thousand dollars monthly. No whiskey. Mississippi license. Dr. J. P. Melvin, Jackson, Miss.

DENTAL MECHANIC, good all-around, available to one or more busy dentists. I have over thirty years' experience. Can furnish excellent references. Would prefer location in New York or close by. "558" Oral Hygiene, Pittsburgh, Pa.

FOR SALE: Established dental office, Youngstown, Ohio; spacious operating room, business office, laboratory, modern reception room. Lease includes two rentals making office almost rent free. Very reasonable. "559" Oral Hygiene, Pittsburgh, Pa.

FOR SALE: Well-equipped two-chair dental office located in one of the best industrial cities in Ohio; population sixty-five thousand. Twenty years in same location. Low overhead, good fees, no Sunday or evening hours. Will sell one-half interest on a percentage basis. "Opportunity" Oral Hygiene, Pittsburgh, Pa.

WANTED: Practice or association; desire to purchase established practice in New York state, or to become associated with a dentist. New York license. "560" Oral Hygiene, Pittsburgh, Pa.

WANTED: Association with established exodontist and oral surgeon. Experienced, staff of two hospitals, railroad surgeons staff and post-graduate work. Licensed in Pennsylvania. "562" Oral Hygiene, Pittsburgh, Pa.

Established high-class laboratory in Texas was A-1, all around technician, from setup to finish, to crown and bridgework. Must have fine background to take charge of a branch laboratory in Texas on a commission basis. High monthly salary guaranteed. Only high-type man looking for future security need apply. "561" Oral Hygiene, Pittsburgh, Pa.

DENTAL PRACTICE, Sparks, Nevada; population eight thousand; mild climate—wish to take partner or will sell and give five-year lease. Dr. H. Iler, Sparks, Nevada.

FOR SALE: Dental practice and complete equipment in Pennsylvania town thirty-two miles from Pittsburgh. Same location for thirty years. Reason for selling; retiring. "563" Oral Hygiene, Pittsburgh, Pa.

FOR SALE: Due to death, Florida practice in large city, established twenty years. Good industrial and agricultural center. Three chairs, x-ray machines, air compressor, and large fully equipped laboratory. "564" Oral Hygiene, Pittsburgh, Pa.

SELLING YOUR PRACTICE: Why not also in the classified columns of The Dental Students Magazine? National circulation 10,200 monthly. This includes over 3,000 recent dental graduates (U.S.A. and Canada). Many of these readers are looking for an opportunity such as you have to offer. SAFZ presents the New THERMOFLOW

PAT. PEND.

Thermal Control Attachments

P—Patient Operated Air, Water Spray.
Physiological advantage. Price \$25.00

**A—Automatic and Synchronized Air, water
spray.** Installed by your dealer. Price \$55.00

**C—Automatic, Synchronized Water, per-
installation by your dealer. Price \$80.00**
Add \$5.00 for Model C. \$5.00 add.

**Available in Three Standard Models
for
AIR, WATER, or BOTH**

REDUCE PAIN by eliminating the frictional heat generated by rotating cutting tools. During cavity preparation, use the **THERMOFLOW** attachment and reduce frictional heat to a minimum by cooling the bur, stone, disk, or diamond point. Provides better vision by removing debris from operating field. Saves time by keeping cutting tools sharper longer and allows for more continuous drilling.

Beautifully Styled Stainless Steel Nozzles

1. Note how streamlined nozzles fit all standard handpieces and contra-angles.
2. No screw needed to tighten nozzles in place.
3. Stainless steel springs and clamps keep plastic tube well out of way.

When ordering specify type of electric current and kind of equipment. Write for folder describing in detail this modern aid to better dentistry.

Your Refine is Triple Checked ..

... for the very last grain of scrap!

"DYNA-FLO", the exclusive Williams process, squeezes out the very last grain of gold, silver, platinum ... and palladium ... from the scrap you send us. There is no chance for error... triple checking of each step assures you of that. Our detailed refining report, checked, doubled-checked, triple-checked, goes with every return we send you. Remember, the bigger we can make our check for your scrap the better we like it. Try our modern refining service for best returns always.

- You may take dental golds in exchange for the value if you desire.

WILLIAMS Gold Refining Co., INC.

You
can
fill
Christmas
stockings
F-U-L-L-E-R
with
bigger
Spyco
checks

Why will Spyco's check for
your dental scrap be BIGGER?
The answer is threefold . . .

1. We pay for the COMPLETE
precious metal content of
your shipment including not
only gold and silver but plat-
inum and palladium as well.
2. Spyco analysis and proc-
esses for recovery of ALL of
the values in dental scrap as-
sure the greatest possible re-
turns.
3. Payment is made
promptly at the highest mar-
ket prices current.

Many dentists make it an
annual practice to entrust
their accumulations to us . . .
Ship direct or through your
dealer. Include scrap gold,
old appliances of all types,
amalgam, discarded jewelry.
Immediate attention and fast
action assured.

Your Spyco check will be
airmailed in ample time for
that Christmas shopping.

SPYCO Smelting & Refining Co.
51-57 South Third St.
Minneapolis 1, Minn.

1. Ipana is recommended by more than twice as many dentists as any other tooth paste.
2. Ipana is used by more than twice as many dentists as any other tooth paste.

(According to a recent nationwide survey.)
